

Technical Comparison of Next-Generation Hydraulic and Electric Powertrain Architectures

Simon Nielsen, Sr. Systems Engineer, Global Research & Development

Outline

- Driving factors in powertrain diversification
- Characteristics of modern system architectures
- Outlook on future powertrain development

Progress in fluid power...

- Electrohydraulic controls
- Bent-axis, 45° kit technology
- Higher pressure and speed capabilities
- Electrohydraulic steering
- Digital hydraulics
- System solutions

...enabling advances in:

- Performance
- Productivity
- Controllability
- Efficiency
- Emissions
- Safety
- Reliability
- Noise

DIGITALIZATION

ELECTRIFICATION

URBANIZATION

GLOBAL MEGA-TRENDS
transforming our world

CLIMATE CHANGE

FOOD SUPPLY

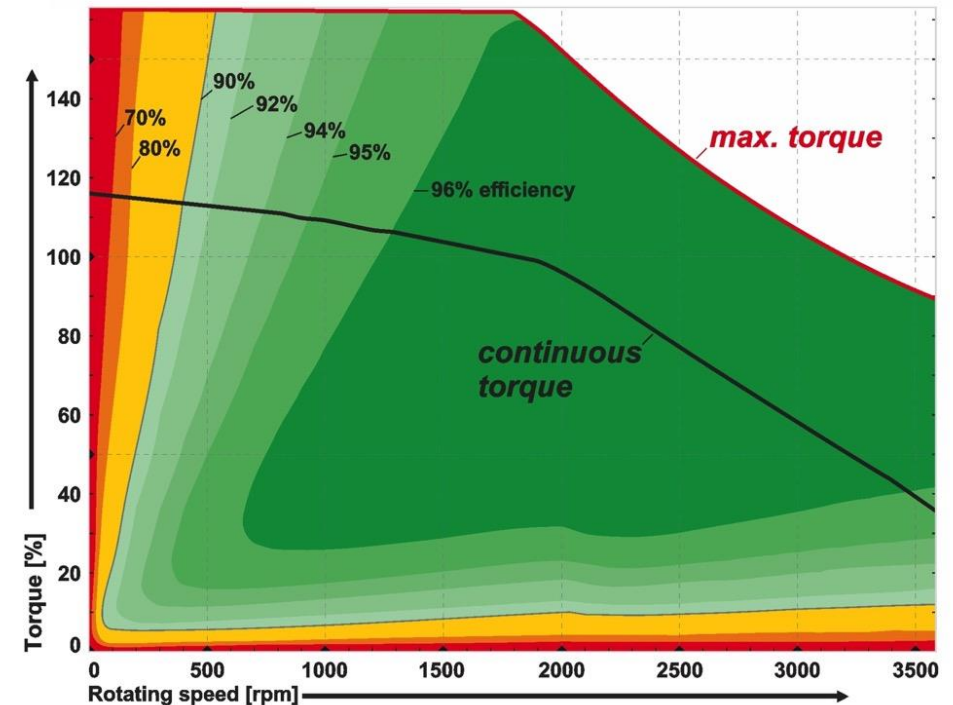

Key electrification drivers

- Increased performance and productivity
- Reduced operational costs
- Zero-emission zones
- Global emission reduction
- “Doing more with less”

Characteristics of high-performance electric drives for off-highway applications

- Wide high-efficiency area
- Liquid cooled
- High peak torque
- Enclosure class IP65; IP67 option
- Internal and external rotor configurations
- Scalable design
- Wide range of power ratings
- Tolerance to shock and vibration

Increasingly diverse product portfolios

Conventional system architecture

- Closed-circuit pump often used for propel
- Open-circuit pump with valve group often used for work functions

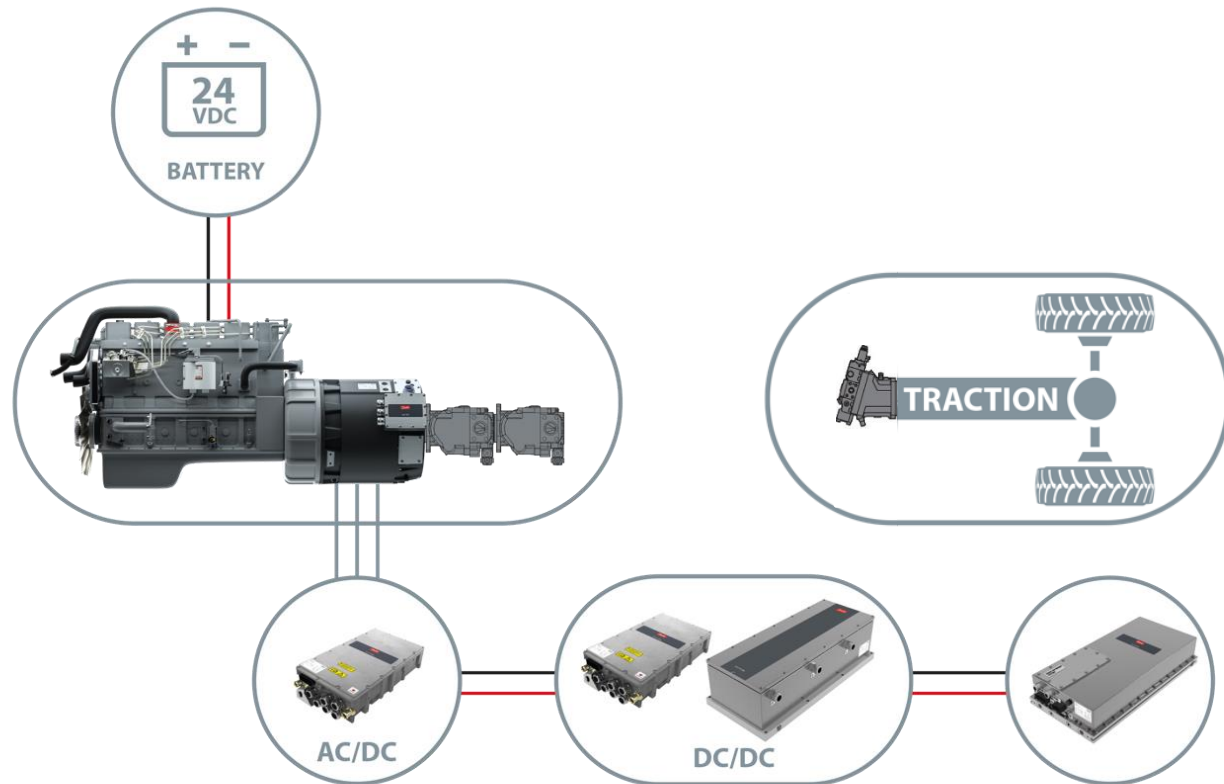

Architectures enabled with electric machines

Motor-generator used as:

- Overall prime mover
- Auxiliary prime mover
- Parallel hybrid M-G
- Series hybrid M-G
- Traction motor

Parallel hybrid

- Peak shaving – ICE downsizing or operate with extra power (for increased productivity)
- Possibility for electric-only driving if engine clutch separates ICE and M-G (P2)
- Possibility to retrofit
- Typical fuel savings up to 10-15%
- Minor emissions reduction overall
- Noise reduction

Case study

Parallel hybrid forest harvester

MAIN BENEFITS

- Power increase +72%
- Productivity increase up to 30%
- 15-25% reduction in fuel consumption per m³ processed
- World's most powerful forest harvester - 380 kW
- Maximum torque – 2000 Nm

Series hybrid

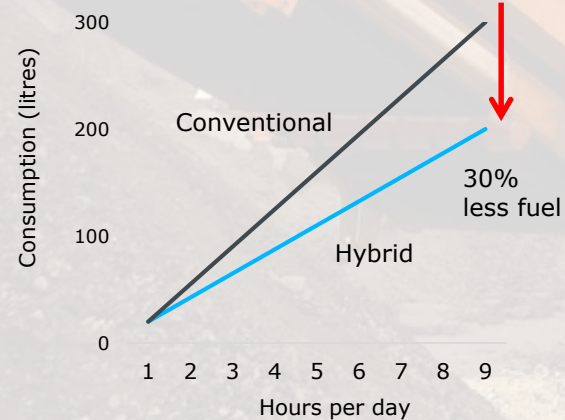

- Peak shaving – major downsizing of ICE, or operate with extra power (for increased productivity)
- Possibility for electric-only operation if configuration allows
- Typical fuel savings of 20-35%
- Emissions reduction
- Noise reduction
- Traction motor(s) must handle full requirements of application

Case study

Series hybrid stone crusher

MAIN BENEFITS

- Saves up to 16,000 L diesel annually
- 40% higher productivity
- 9 month payback period
- First-of-its-kind hybrid on the market
- Optional capability to run off of a grid connection

Full electric 1

- Zero emission vehicle
- Significant noise reduction
- Major efficiency improvement

Case study

Battery-electric mine vehicle

MAIN BENEFITS

- Health protection for miners through emission-free electromobility
- Cost reduction through lower fuel and ventilation costs
- Up to 50 percent lower energy costs

Full electric 2

- Engine replaced by electric machine
- Retain existing transmission

Case study

Battery-electric excavator

MAIN BENEFITS

- Zero emissions
- Significantly quieter
- Safer and more reliable operations

What about linear actuation, work functions?

- Hydraulic cylinders have long been the standard and are difficult to beat
 - Robustness
 - Production cost
 - Force density
 - Simplicity
- Open-circuit system efficiencies are largely impacted by throttling and idling losses. Some means to address this include:
 - Improvements in valve metering technology
 - Displacement-controlled actuators
- Electromechanical and electrohydraulic linear actuators remain in concept and research stage
- Electric pump drives increasingly available

Digital Displacement® Technology

Digital Displacement Pump (DDP):

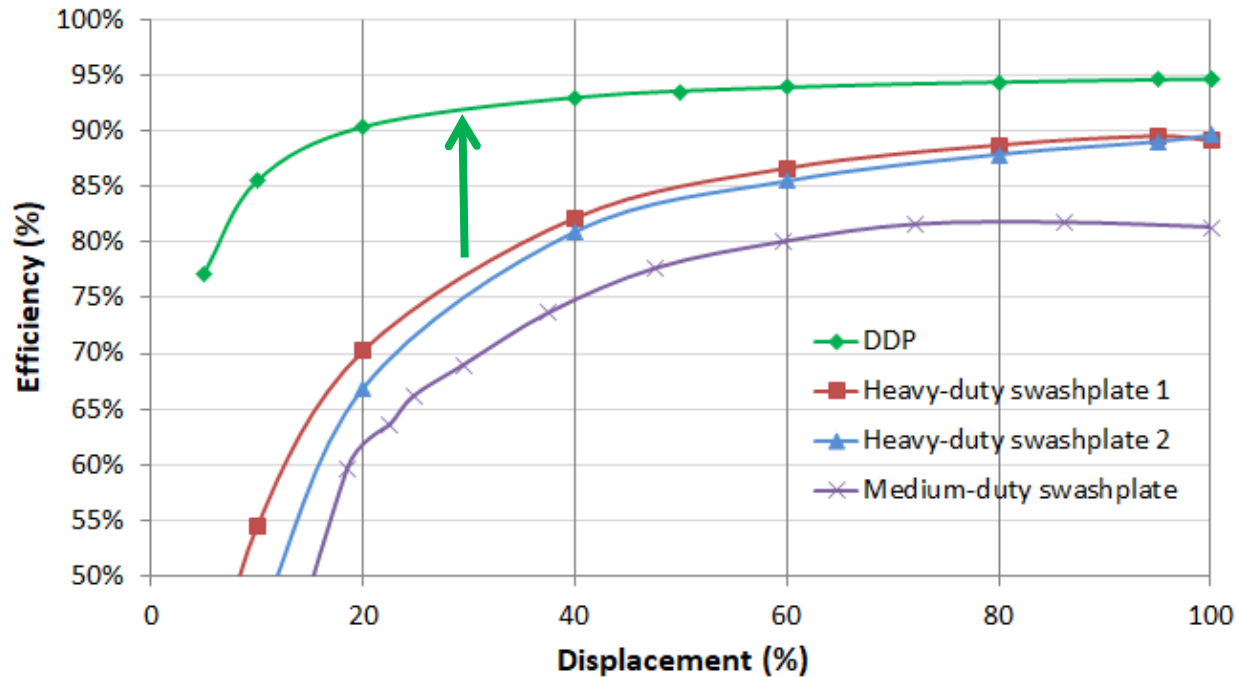

- Radial-piston design
- Digital control of each piston
- High efficiency, low idle losses
- 420 bar continuous capability
- Fast and accurate response
- Control modes and parameters electronically tunable
- Capable of multiple output ports

DDP efficiency & losses

Efficiency:

Pump Efficiency, 200 bar, 1500 rpm

Losses:

Pump Losses, 200 bar, 1500 rpm, Scaled to 96cc/rev

Technology project: Excavator conversion to DDP

- New, CAT 320 next-generation excavator
- Original, axial-piston, swashplate pumps exchanged for DDP in tandem
- All other engine and machine controls left in original state

Post-conversion test results (vs. original configuration)

Productivity (mass excavation):

- 16% more weight/hr
- 7% more weight/L fuel

Trenching:

- 15% further after one hr
- Consumed 13% less fuel per m

Budden, J. and Williamson, C. 2019. Danfoss Digital Displacement[®] Excavator: Test Results and Analysis. ASME/BATH 2019 Symposium on Fluid Power and Motion Control. Sarasota, FL, USA.

Digital Displacement® as a tool in electrification

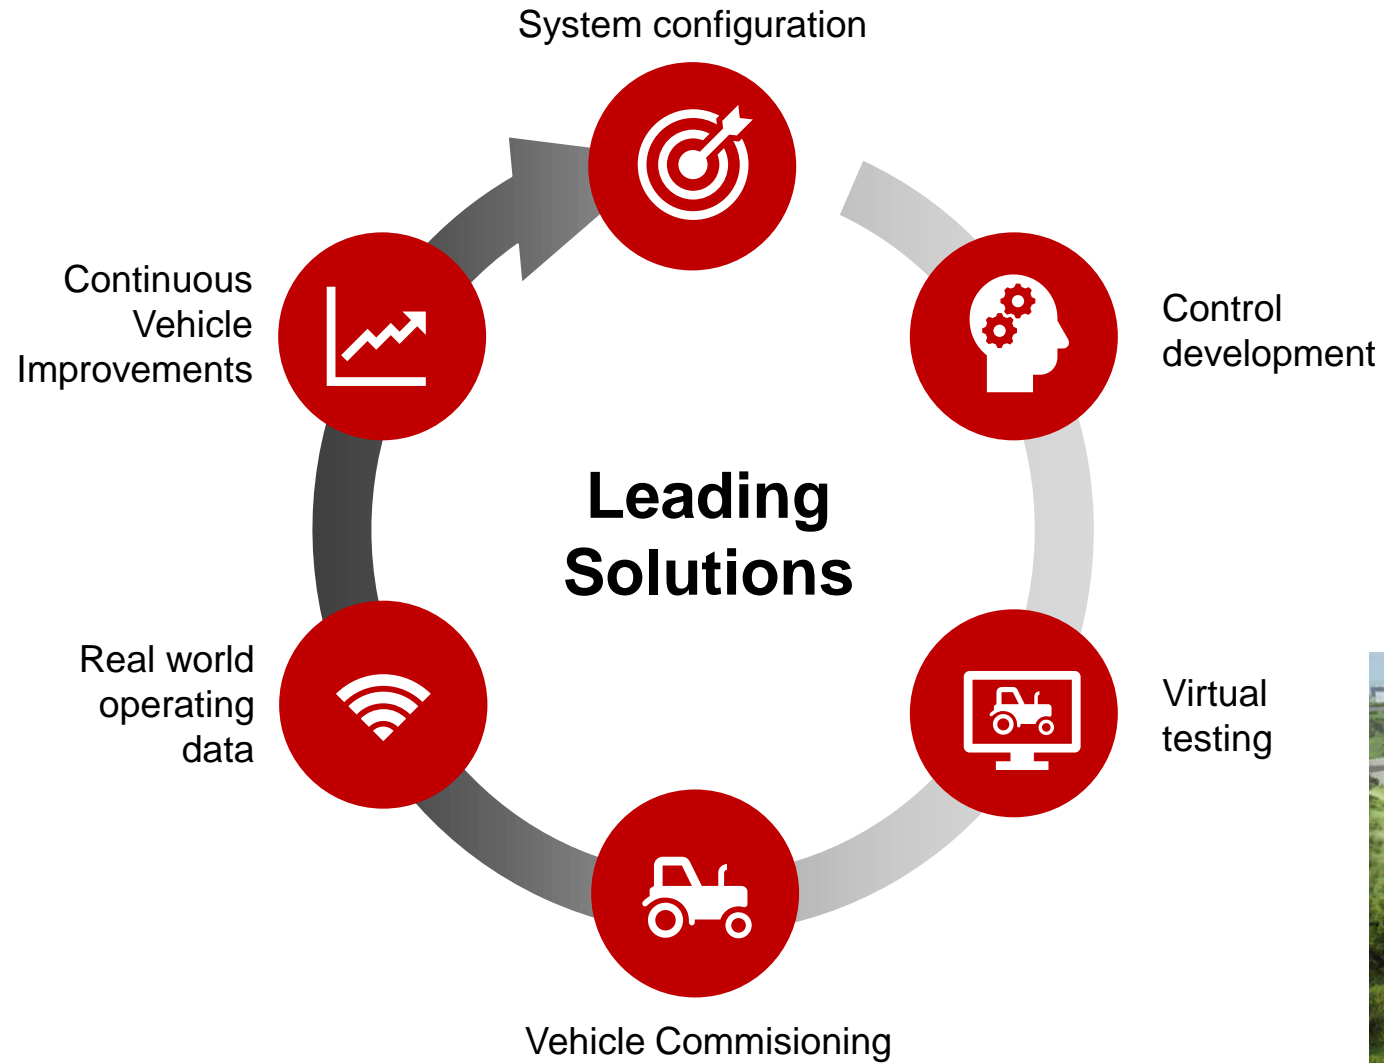

- Efficiency has increased value on BEVs
- DDP may have a lower hurdle cost than other methods for reducing power and battery capacity
- Internal analysis shows that the Pon battery-electric excavator with DD architecture SA2 (multi-output + control valves) could achieve the same working capability and run time with **20-25% less battery capacity**

Overall challenges we see in electrification

- Energy storage
- Charging infrastructure
- Power/torque/force density vs. hydraulics
- Working out the business case and TCO compared with current price points of hydraulic products
- Field service and support
- Training the workforce

Solution development approach

Which system architecture should I choose?

- Ability to modify machine design?
- Maximize productivity or efficiency?
- TCO vs. initial cost?
- Zero-emission operation needed?
- High- or low-utilization duty cycle?
- Ability to recover energy?
- Access to energy source?
- Shift length?

Digital calculation tools

Get started with the configuration

Application Type: Wheel loader

Segment: Small | System architecture: EDITRON electric I

Size: 12 tons

The chosen system architecture consists of

Energy storage
 Generic electric power source
 Battery pack size 100kWh

Central traction
 Electric Converter
 EC-C1200-450 x1

Electric Motor/Generator
 EM-PMI375-T500

RPM: 1100
 Cont/Peak Torque [Nm]: 572/1490
 Cont Power [kW]: 66

Print & View the full systems

System Benefits

- + Zero emission
- + Noise reduction

Fuel consumption
 -100%
 100% (Conventional) vs 0% (Benefit)

Productivity improvement
 30%
 100% (Conventional) vs 130% (Benefit)

Battery Information

- Battery Size: 100 kWh
- WL Mass: 12 t
- WL Power: 109 kWh
- WL avg. Power: 33 kWh

Operation Time
 3:39

Vehicle development

Evaluating applications with duty-cycle data

Scenario 1

Work in and around main farm site

Avg. utilization of rated engine power

Daily energy consumption of this work type never exceeded 100 kWh

30-80%

**Reduction in
CO₂ emissions
for most of EU**

Scenario 2

Work completed over repeated trips

35%

Avg. utilization of rated engine power

Histogram, Daily Energy Used (kWh)

BEV feasible in some cases, using high-power charging between trips and during regular break periods

10%

reduction in overall
energy consumption
possible with
regenerative braking

Scenario 3

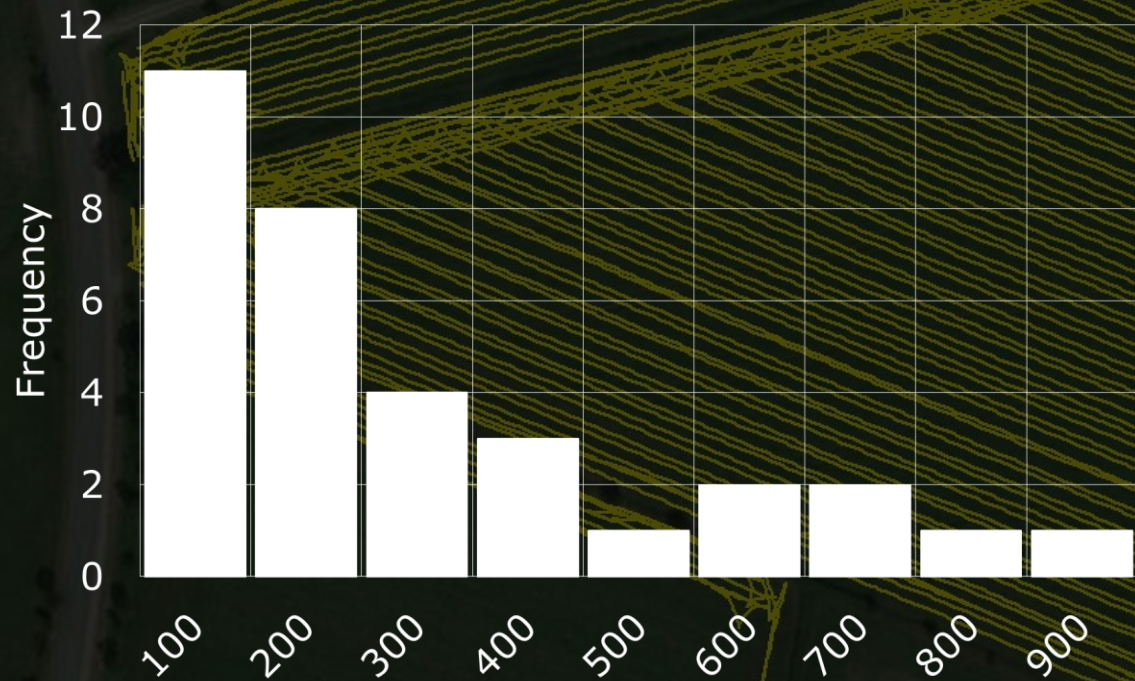

Extended work at remote sites

50%

Avg. utilization of rated engine power

Histogram, Daily Energy Used (kWh)

Remote, high-power operations over extended periods better suited to ICE-based drivetrains

Our outlook

- System solution portfolio will become more diverse
- Electric and hydraulic component technology will become more integrated
- Mobile hydraulics have some unique advantages that will be difficult to replace in the short run
- Improvements to hydraulic system efficiency will continue to have merit
- Electrification will be largely driven by zero-emission requirements and productivity improvement
- Digital tools and technology demonstrators will support development activities
- **Many companies joining electric revolution; Integrated hydraulics suppliers have some advantages**

Thank you
