1 Introduction

1.1 Purpose of the Manual

The design guide provides the information required to select and plan installation of the right brake resistor for an application:

- Selection of the correct brake resistor.
- Pre-installation considerations.
- Programming.

As an alternative to using a brake resistor, other braking methods can be applied depending on the braking profile of the application, see *chapter 7 Special Conditions*.

More technical literature is also available online at drives.danfoss.com/knowledge-center/technical-documentation/.

1.2 Conformity

Table 1.1 Approval

1) See Table 9.2 and Table 9.4 for UL conformity.

What is CE conformity and labeling

The purpose of CE labeling is to avoid technical trade obstacles within EFTA and the EU. The EU has introduced the CE label as a simple way of showing whether a product complies with the relevant EU directives. The CE label says nothing about the specifications or quality of the product. Brake resistors are regulated by the following EU directive:

The Low Voltage Directive (2014/35/EU)

Brake resistors must be CE labeled in accordance with the Low Voltage Directive of April 20, 2016. The directive applies to all electrical equipment and appliances used in the 50–1000 V AC and the 75–1500 V DC voltage ranges. Danfoss CE-labels in accordance with the directive and issues a declaration of conformity after request.

1.3 Safety Precautions

WARNING SURFACE TEMPERATURE

When in use, the brake resistor surface temperature rises.

- DO NOT touch the brake resistor during operation.

WARNING HAZARD DURING OPERATION

Work on a brake resistor in operation can result in serious injury.

- Never work on a brake resistor in operation.
- Ensure that only trained and qualified personnel can work on a brake resistor.

NOTICE

Never attempt to repair a defective brake resistor.

1.4 Disposal

Equipment containing electrical components may not be disposed of together with domestic waste.

It must be separately collected with electrical and electronic waste according to local and currently valid legislation.

2 Product Overview

2.1 Description of the Brake System

When the speed reference of a frequency converter is reduced, the motor acts as a generator and the frequency converter brakes. When a motor acts as a generator, it supplies energy to the frequency converter which is collected in the DC link. The function of the brake resistor is to provide a load on the DC link during braking, thereby ensuring that the braking power is absorbed by the brake resistor.

If a brake resistor is not used, the DC-link voltage of the frequency converter continues to increase, until disconnecting for protection. The advantage of using a brake resistor is that it enables braking of a heavy load quickly, for example on a conveyor belt.

The brake resistors in this series are all external components. Therefore, the brake resistor does not form an integral part of the frequency converter.

The external brake resistor provides the following advantages:

- The resistor time cycle can be selected as required.
- The heat developed during braking can be conveyed beyond the panel cabinet to allow the energy to be used.
- The electronic components do not overheat, even when the brake resistor is overloaded.

2.2 Horizontal or Vertical Load

2.2.1 How to Select

The Danfoss brake resistor range consists of 2 groups:

- Brake resistors for horizontal loads (conveyors, trolleys, gantry cranes, and so on), see *Illustration 2.1*;
- Brake resistors for vertical loads (cranes, hoists, elevators), see *Illustration 2.2*.

Illustration 2.1 Horizontal Loads

175UA067.10

Illustration 2.2 Vertical Loads

175UA068.10

The brake resistor range is intended to cover the general braking requirements for horizontal and vertical brake applications.

To select the best brake resistor for an application, refer to *chapter 8.1 Selection Flow Chart*. The flow chart links to further information, either selection tables or calculations of inertia or duty cycle.

To cater for both the horizontal and vertical ranges, 3 types of brake resistors are available:

- Aluminum-housed flat-pack brake resistors.
- Aluminum-housed compact brake resistors.
- Steel grid brake resistors.

2.3 Aluminum-housed Brake Resistors

2.3.1 Aluminum-housed Flat-pack Brake Resistors

The flat-pack brake resistor is an anodized aluminum-housed resistor suitable for wall mounting or on a footprint or an L-profile bracket. The L-profile bracket is used for rear mounting. The brake resistor is designed for high pulse loads of up to 40 times the nominal load and is therefore suitable for both vertical and horizontal applications. The enclosure protection is IP54 or IP65.

Illustration 2.3 Flat-pack IP54

130BD245.12

2

2.3.2 Aluminum-housed Compact Brake Resistor

The compact brake resistor is housed in aluminum profiles with pre-mounted brackets for wall mount. It is designed for high pulse loads of up to 60 times the nominal load and is therefore used for both horizontal and vertical loads. The enclosure protection class is either IP21, IP54, or IP65. The brake resistor IP classes IP21 and IP65 are equipped with a connection box containing cable glands and cable connection to the resistor and the temperature switch. IP54 versions have fixed unshielded cables.

Illustration 2.4 CBR-V-CT IP54

Illustration 2.5 CBR-V-DT IP21

Illustration 2.6 CBR-V-BT IP65

2.4 Steel Grid Brake Resistors

The steel grid brake resistor is steel grid housed and consists of multiple elements. This brake resistor is suitable for pulse loads between 10 and 20 times the nominal load, suitable for frequent braking applications such as cranes, hoists, and elevators. It is supplied in an IP20 enclosure with cable glands and has a built-in temperature switch.

Illustration 2.7 Steel Grid House IP20

3 Installation

3.1 Mechanical Installation

The brake resistors are cooled by natural convection, and the specified minimum clearances must be observed to ensure efficient ventilation. The ventilation must be efficient enough to dispatch the regenerative power in the brake resistor.

NOTICE

When installing the brake resistor, ensure that all precautions are in place to avoid the risk of overloading. Overloading can lead to a fire hazard due to the heat generated in the brake resistor.

The brake resistor is hot during or after braking. The brake resistor must be located in a secure environment to avoid fire risk.

- Mount the brake resistor free of any combustible materials at a well-ventilated location.
- The VLT® Brake Resistors MCE 101 brake resistors product type 9xx contain a built-in temperature switch (for overtemperature protection purposes. See *chapter 3.3 Protective Functions*).

3.1.1 Aluminum-housed Compact Brake Resistors and Flat-pack Brake Resistors

The aluminum-housed compact and flat-pack brake resistors are designed for vertical mounting for optimum cooling performance. However, horizontal mounting is possible for both flat-pack and compact brake resistors. Derating with 20% is required when mounting the compact brake resistors horizontally. No derating for flat-packs are required. The enclosure protection of the IP21 types is reduced to IP20 when mounted horizontally.

NOTICE

All resistors are cooled by natural convection. To ensure sufficient airflow and cooling, follow minimum clearance in *Illustration 3.1* to *Illustration 3.8*.

Vertical mounting, IP54

For minimum clearances for vertical mounting for all aluminum-housed compact and flat-pack brake resistors, see *Illustration 3.1* and *Illustration 3.2*.

Orientation, compact and flat-pack brake resistors

Illustration 3.9 Orientation of Compact and Flat-pack Brake Resistors

Derating with 20% is required when mounting the compact brake resistors horizontally. The enclosure protection of the IP21 types is reduced to IP20 when mounted horizontally.

3.1.2 Steel Grid Brake Resistors

The steel grid brake resistors are designed for horizontal mounting only.

NOTICE

All resistors are cooled by natural convection. To ensure sufficient airflow and cooling, follow minimum clearances in *Illustration 3.10* and *Table 3.3*.

Illustration 3.13 Flat-pack Brake Resistor Mounted at Rear of Frequency Converter

3.1.3 Accessories

Footprint brackets

The footprint bracket is an accessory used for mounting flat-pack brake resistors.

Use the footprint bracket to mount the brake resistor at the rear of the frequency converter. Once mounted, the combined brake resistor and frequency converter occupy the same space in the cabinet as the frequency converter alone.

Part number	Compatible brake resistor	Compatible frequency converter enclosure size
175U0085	1x100 W flat-pack 1x200 W flat-pack	A2
175U0087	2x100 W flat-pack 2x200 W flat-pack	A2
175U0086	2x100 W flat-pack 2x200 W flat-pack	A3
175U0088	1x100 W flat-pack 1x200 W flat-pack	A3

Table 3.1 Selection Table

For mechanical dimensions for footprint brackets, see *chapter 9.8.2 Mounting Brackets: Footprint*.

L profile brackets

The L profile bracket is an accessory used for mounting flat-pack brake resistors. The L profile brackets support both horizontally and vertically mounting on a fixed surface optimizing the required footprint.

Illustration 3.14 L Profile Bracket

Part number	Compatible brake resistor

175U0011 ¹⁾	1x100 W flat-pack 1x300 W flat-pack

Table 3.2

1) Order 2x175U0011 for 300 W flat-pack brake resistors.

For mechanical dimensions for L profile brackets, see chapter 9.8.1 Mounting Brackets: L Profile.

3.2 Electrical Installation

3.2.1 EMC Precautions

The following EMC precautions are recommended to achieve interference-free operation of fieldbus cable(s) and digital and analog inputs and outputs.

Observe relevant national and local regulations, for example regarding protective earth connection. Keep the fieldbus cable(s) away from motor cables and brake resistor cables to avoid coupling of high frequency noise from one cable to another. Normally, a distance of 200 mm (8 inches) is sufficient, but keeping the greatest possible distance between the cables is recommended, especially where cables run in parallel over long distances. When crossing is unavoidable, the fieldbus cable(s) must cross motor cables and brake resistor cables at an angle of 90°, see Illustration 3.15.

Illustration 3.15 Cable Routing

3.2.2 Cable Connection

NOTICE

To comply with EMC emission specifications, shielded/armored cables are recommended.

NOTICE

Cables general: All cabling must comply with national and local regulations on cable cross-sections and ambient temperature.

See Table 3.3 for recommended temperature ratings for all cables and conductors connected to the brake resistor as ground connection, thermal switch, and brake power.

IP class	Recommended cables
IP20	≥80 °C (176 °F)
IP21	≥80 °C (176 °F)
IP54	≥90 °C (194 °F) ¹⁾
IP65	≥90 °C (194 °F)

Table 3.3 Cable Temperature Ratings

1) For ground connection.

How to connect more than 1 resistor

Star parallel connection to ensure that load is shared evenly between 2 or more resistors.

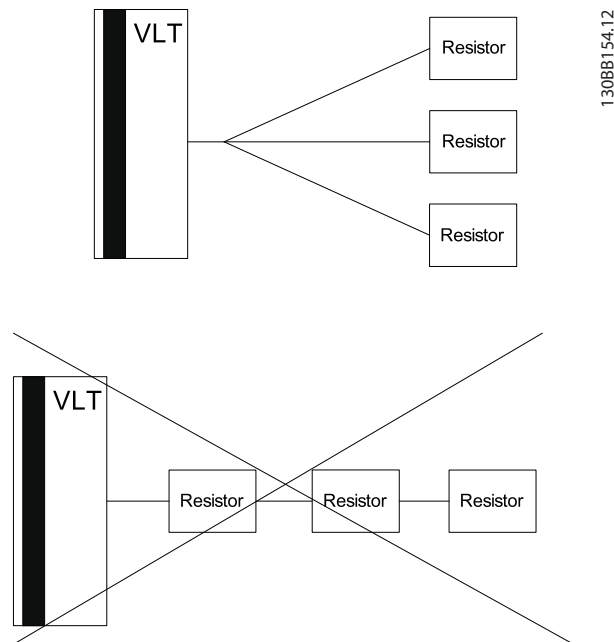

Illustration 3.16 Connection of Several Brake Resistors

Brake resistors with fixed cables

To reduce the electrical noise from the wires between the brake resistor and the frequency converter, twist the wires. For enhanced EMC performance, a metal shield can be used.

(1)	Twisted pair
(2)	Shielded cable

Illustration 3.17 Twisted Cables

3.2.3 Brake Cable

Maximum length: 20 m (66 ft) shielded cable.

Ensure the connection cable to the brake resistor is shielded. Connect the shielding to the conductive back plate of the frequency converter and to the brake resistor metal cabinet, using cable clamps.

3.3 Protective Functions

3.3.1 Overtemperature Protection

Danfoss VLT® Brake Resistors MCE 101 is equipped with a galvanic isolated temperature switch (PELV) that is closed under normal operating conditions and open if the brake resistor is overheated.

NOTICE

Use the temperature switch as overtemperature protection feature to prevent damage of the brake resistor caused by overtemperature. To prevent damage to the brake resistor, perform an immediate stop or a ramp down.

There are several ways the temperature switch can be used:

The temperature switch as digital input to frequency converter

Example 1

1. Connect terminal T1 of the brake resistor to the frequency converter terminal 12 or 13.
2. Connect terminal T2 of the brake resistor to a digital input, for example terminal 18.

Automatic restart after enabling of the temperature switch:

Select *coast inverse* for the selected digital input.

Prevent automatic restart:

Select *latched start* for the selected digital input.

NOTICE

Coast does not terminate the brake function.

Example 1

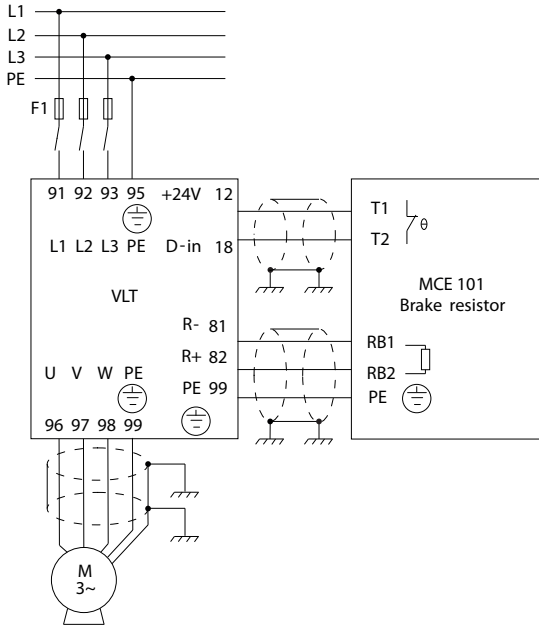

Illustration 3.18 Temperature Switch in Brake Resistor

NOTICE

The temperature switch as input to the frequency converter cannot be considered a primary safety function.

In case of a malfunction in the brake IGBT, the frequency converter and brake resistor are only protected by disconnecting the mains supply to the frequency converter. The temperature switch must be connected disabling the mains supply to the frequency converter by a contactor preventing dangerous overtemperatures.

The temperature switch disabling the mains supply to VLT by a contactor

Example 2

1. Connect the brake resistor built-in thermal switch as controlling an input contactor. In this example, the thermal switch within the brake resistor is connected in series with the thermal switch within the motor.
2. Connect start and stop push buttons in series with the thermal switches.
3. Connect to a contactor in the mains supply in front of the frequency converter.

Thermal overheating in brake resistor or motor disables the mains supply to the frequency converter.

Example 2

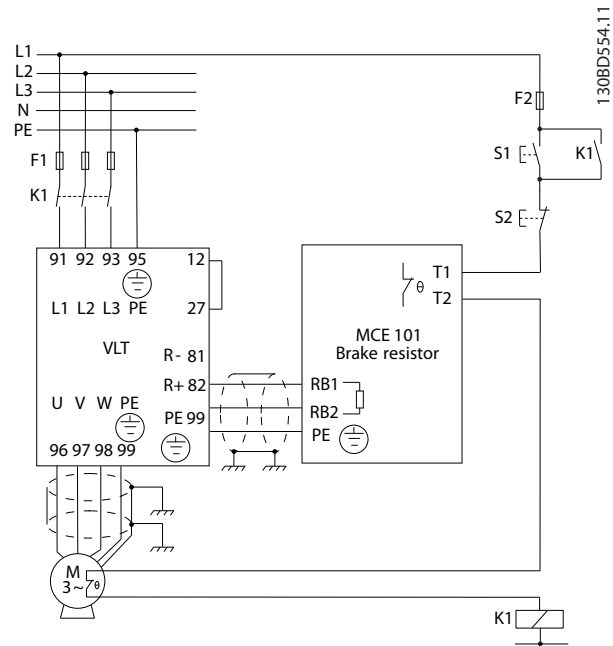

Illustration 3.19 Temperature Switch in both Motor and Brake Resistor Disabling Mains Supply by an Input Contactor

Thermo relay disabling the brake resistor

Example 3

Calculate the brake current ($I_{\text{thermo relay}}$) setting of the temperature switch as follows:

$$I_{\text{thermo relay}} = \sqrt{\frac{P_{\text{brake resistor max}}}{R_{\text{br}}}}$$

R_{br} is the current brake resistor value calculated in *chapter 4.1.2 Calculation of Brake Resistor Resistance*.

Look up the brake current setting of the thermo relay for Danfoss brake resistors in *chapter 8 Selection Guide*.

3.3.2 Brake Resistor and Brake IGBT

Brake resistor power monitor

In addition, the brake power monitor function makes it possible to read out the momentary power and the mean power for a selected time period. The brake can also monitor the power energizing and make sure that it does not exceed a limit selected in *parameter 2-12 Brake Power Limit (kW)*. In *parameter 2-13 Brake Power Monitoring*, select the function to carry out when the power transmitted to the brake resistor exceeds the limit set in *parameter 2-12 Brake Power Limit (kW)*.

NOTICE

Monitoring the brake power does not fulfill a safety function. The brake resistor circuit is not ground leakage protected.

The brake is protected against short-circuiting of the brake resistor, and the brake transistor is monitored to ensure that short-circuiting of the transistor is detected. Use a relay or digital output to protect the brake resistor against overloading in the event of a fault in the frequency converter, see *chapter 3.3.1 Overtemperature Protection*.

Overvoltage control (OVC) can be selected as an alternative brake function in *parameter 2-17 Over-voltage Control*. If the DC-link voltage increases, this function is active for all units. The function ensures that a trip can be avoided. This is done by increasing the output frequency to limit the voltage from the DC link. It is a useful function, for example if the ramp-down time is too short since tripping of the frequency converter is avoided. In this situation, the ramp-down time is extended.

4 System Integration

4.1 Brake Resistor Calculation

To ensure the optimal selection of brake resistor for a given application, its inertia and braking profile calculations are required.

This chapter explains the calculations required to obtain values for optimal selection of brake resistor for a given application.

4.1.1 Brake Set-up

The following sections use expressions and abbreviations related to the brake set-up in *Illustration 4.1*.

175ZA096.14

Illustration 4.1 Brake Set-up

4.1.2 Calculation of Brake Resistor Resistance

To prevent the frequency converter from cutting out for protection when the motor brakes, select resistor values on the basis of the peak braking power and the DC-link voltage:

$$R_{br} = \frac{U_{dc}^2}{P_{peak}} [\Omega]$$

The brake resistor performance depends on the DC-link voltage (U_{dc}).

U_{dc} is the voltage, where the brake is activated. The FC-series brake function is settled depending on the mains supply.

DC-link voltage (U_{dc}), VLT® AutomationDrive FC 360

Size [V]	Brake active [V DC]	Overvoltage warning [V DC]	Overvoltage alarm [V DC]
FC 360 3x380–480, 0.37–22 kW (0.5–30 hp)	700–770 ¹⁾	800	800
FC 360 3x380–480, 30–75 kW (40–100 hp)	N/A ²⁾	800	800

Table 4.1 DC-link Voltage (U_{dc}), FC 360

- 1) Adjustable with parameter 2-14 Brake voltage reduce
- 2) No built-in brake option

Use the brake resistance R_{rec} , to ensure that the frequency converter is able to brake at the highest braking torque ($M_{br(\%)}$) (for example 160%). The formula is written as:

$$R_{rec} [\Omega] = \frac{U_{dc}^2 \times 100}{P_{motor} \times M_{br(\%)} \times \eta_{VLT} \times \eta_{motor}}$$

η_{motor} is typically at 0.90

η_{VLT} is typically at 0.98

When a higher brake resistor resistance is selected, 160%/150%/110% braking torque cannot be obtained, and there is a risk that the frequency converter cuts out of DC-link overvoltage for protection.

For braking at lower torque, for example 80% torque, it is possible to install a brake resistor with lower power rating. Calculate size using the formula for calculating R_{rec} .

4.1.3 Calculation of Braking Power

When calculating the braking power, ensure that the brake resistor is scaled for the average power as well as the peak power.

- The average power is determined by the process period time, that is the length of the braking time in relation to the process period time.
- The peak power is determined by the braking torque, which means that as braking progresses, the brake resistor must be able to dissipate the energy input.

Illustration 4.2 shows the relation between the average power and the peak power.

T_p	Process period time in s
T_b	Braking time in s

Illustration 4.2 Relation between Average Power and Peak Power

4.1.4 Calculation of the Brake Resistor Peak Power

$P_{peak, mec}$ is the peak power by which the motor brakes on the motor shaft. Calculate $P_{peak, mec}$ as follows:

$$P_{peak, mec} = P_{motor} \times M_{BR(\%)} [W]$$

P_{peak} is the braking power dissipated to the brake resistor when the motor brakes.

P_{peak} is lower than $P_{peak, mec}$ since the power is reduced by the efficiencies of the motor and the frequency converter.

Calculate P_{peak} as follows:

$$P_{peak} = P_{motor} \times M_{BR(\%)} \times \eta_{motor} \times \eta_{VLT} [W]$$

When the brake resistor recommended by Danfoss is selected (R_{rec}) on the basis of the tables in chapter 8 Selection Guide, the brake resistor is certain to provide a braking torque of 160%/150%/110% on the motor shaft.

4.1.5 Calculation of the Brake Resistor Average Power

The average power is determined by the length of the braking time in relation to the process period time.

When the kinetic energy (E_b) transferred to the resistor in each braking sequence is known (see chapter 6.1 Conveyor Belt and chapter 6.2 Centrifuge), calculate the average power of the brake resistor as follows:

$$P_{avg} = \frac{E_b}{T_p} [W]$$

T_p = period time in s, see Illustration 4.2.

When the kinetic energy transferred to the resistor in each braking sequence is not known, calculate the average power based on the process period time and the braking time.

Calculate the duty cycle for the braking sequence as follows:

$$\text{Duty cycle} = \frac{T_b \times 100}{T_p} [\%]$$

where

T_p = process period time in s

T_b = braking time in s

Danfoss offers brake resistors with a duty cycle of maximum 10% and 40%. If a 10% duty cycle is applied, the brake resistors are able to absorb P_{peak} for 10% of the period time. The remaining 90% of the period time is used on deflecting excess heat.

Calculate the average power with 10% duty cycle as follows:

$$P_{avg} = P_{peak} \times 10\% [W]$$

Calculate the average power with 40% duty cycle as follows:

$$P_{avg} = P_{peak} \times 40\% [W]$$

The calculations apply to intermittent braking using a period time of 30 s.

NOTICE

Exceeding the specified intermittent braking period time may result in overheating the resistor.

4

4.1.6 Braking of Inertia

When braking high inertia values on the motor shaft, base the brake resistor values on the inertia, $\Delta\omega$, Δt , see *Illustration 4.3*.

Illustration 4.3 Braking of High Inertia

Δt is determined by the ramp-down time.

NOTICE

The ramp-down time goes from the rated motor frequency to 0 Hz.

P_{peak} can be calculated as:

$$P_{peak} = \eta_{motor} \times \eta_{VLT} \times \omega_{start} \times j \times \frac{\Delta\omega}{\Delta t}$$

$$P_{peak} = \eta_{motor} \times \eta_{VLT} \times n_{start} \times j \times \left(\frac{2 \times \pi}{60}\right)^2 \times \frac{\Delta n}{\Delta t}$$

j is the motor shaft inertia.

5 Parameters

For descriptions of all available parameters, see *VLT® AutomationDrive FC 360 Programming Guide*, which is available from drives.danfoss.com/knowledge-center/technical-documentation/.

2-10 Brake Function		
Option:	Function:	
[0] *	Off	No brake resistor is installed.
[1]	Resistor brake	A brake resistor is incorporated in the system for dissipating surplus brake energy as heat. Connecting a brake resistor allows a higher DC-link voltage during braking (generating operation). The brake resistor function is only active in frequency converters with an integral dynamic brake.
[2]	AC brake	<p>Improve braking without using a brake resistor. This parameter controls an overmagnetization of the motor when running with a generative load. This function can improve the OVC function. Increasing the electrical losses in the motor allows the OVC function to increase braking torque without exceeding the voltage limit.</p> <p>NOTICE The AC brake is not as efficient as dynamic braking with resistor. AC brake is for VVC+ mode in both open and closed loop.</p>

2-11 Brake Resistor (ohm)		
Range:	Function:	
Size related* [0 - 65535 Ohm]	Set the brake resistor value in Ω. This value is used for monitoring the power to the brake resistor. <i>Parameter 2-11 Brake Resistor (ohm)</i> is only active in frequency converters with an integral dynamic brake. Use this parameter for values without decimals.	

2-12 Brake Power Limit (kW)		
Range:	Function:	
Size related* [0.001 - 2000 kW]	<p><i>Parameter 2-12 Brake Power Limit (kW)</i> is the expected average power dissipated in the brake resistor over a period of 120 s. It is used as the monitoring limit for <i>parameter 16-33 Brake Energy Average</i> and specifies when a warning/alarm is given. To calculate <i>parameter 2-12 Brake Power Limit (kW)</i>, the following formula can be used.</p> $P_{br,avg}[W] = \frac{U_{br}^2[V] \times t_{br}[s]}{R_{br}[\Omega] \times T_{br}[s]}$ <p>$P_{br,avg}$ is the average power dissipated in the brake resistor. R_{br} is the resistance of the brake resistor. t_{br} is the active braking time within the 120 s period T_{br}. U_{br} is the DC voltage where the brake resistor is active. For T4 units, the DC voltage is 778 V, which can be reduced by <i>parameter 2-14 Brake voltage reduce</i>.</p> <p>NOTICE If R_{br} is not known or if T_{br} is different from 120 s, the practical approach is to run the brake application, read out <i>parameter 16-33 Brake Energy Average</i>, and then enter this value + 20% in <i>parameter 2-12 Brake Power Limit (kW)</i>.</p>	

2-14 Brake voltage reduce		
Range:	Function:	
0 V* [0 - 0 V]	Setting this parameter may change the brake resistor (<i>parameter 2-11 Brake Resistor (ohm)</i>).	

2-16 AC Brake, Max current		
Range:	Function:	
100 %* [0 - 160 %]	<p>Enter the maximum allowed current when using AC brake to avoid overheating of motor windings.</p> <p>NOTICE <i>Parameter 2-16 AC Brake, Max current</i> has no effect when <i>parameter 1-10 Motor Construction</i> is set to [1] PM, non-salient SPM.</p>	

5

2-17 Over-voltage Control		
Option:	Function:	
		Overvoltage control (OVC) reduces the risk of the frequency converter tripping due to an overvoltage on the DC link caused by generative power from the load.
[0] *	Disabled	No OVC required.
[1]	Enabled (not at stop)	Activate OVC except when using a stop signal to stop the frequency converter.
[2]	Enabled	Activate OVC. <div style="border: 1px solid black; padding: 2px; display: inline-block;">⚠ CAUTION</div> PERSONAL INJURY AND EQUIPMENT DAMAGE Enabling OVC in hoisting applications may lead to personal injuries and equipment damage. <ul style="list-style-type: none"> • DO NOT enable OVC in hoisting applications.

6 Application Examples

6.1 Conveyor Belt

Illustration 6.1 shows the relation between the braking power and the acceleration/braking of a conveyor belt.

Note:

- The motor power during braking is negative, since the torque on the motor shaft is negative.
- The motor power is time-dependent.

The braking power (the power to be dissipated to the brake resistor) corresponds almost exactly to the negative motor power plus losses in the motor and the frequency converter.

Kinetic energy (E) in conveyor belt + motor:

$$E = 0.5 \times m \times v^2 + 0.5 \times j \times \omega^2 [Ws]$$

where

- m = mass with linear movement [kg].
- v = speed of mass with linear movement [m/s].
- j = inertia of motor and gear box [kgm²].
- ω = motor speed [rad/s].

$$\omega = \text{motor speed} = \frac{n \times 2\pi}{60} [\text{rad/s}]$$

This formula is also expressed as follows:

$$E = 0.50 \times m \times v^2 + 0.0055 \times j \times n^2 [Ws]$$

However, not all of the energy is dissipated in the brake resistor. The friction of the conveyor belt and the power loss of the motor also contribute to the braking function. So, the formula for energy dissipation (E_b) to the brake resistor is as follows:

$$E_b = (0.5 \times m v^2 + 0.5 j \omega^2 - 0.5 \times M_f \omega) \times \eta_M [Ws]$$

where

M_f = Friction torque [Nm].

η_M = Motor efficiency.

Insert:

$$\omega = \frac{n \times 2\pi}{60}$$

The result is:

$$E_b = (0.5 \times m v^2 + 0.0055 \times j \times n^2 - 0.052 \times n \times M_f) \times \eta_M [Ws]$$

Illustration 6.1 Conveyor Belt: Relation Between Braking Power and Acceleration/Deceleration

6.2 Centrifuge

Illustration 6.2 Centrifuge with Brake Resistor

6

Illustration 6.2 shows braking of a centrifuge, which is a typical application of brake resistors.

The formula for energy dissipation (E_b) to the brake resistor is:

$$E_b = (0.0055 \times j_c \times n_2^2 + 0.0055 \times j_M \times n_1^2) \times \eta_M [Ws]$$

where

m = weight of the centrifuge content [kg].

j_c = centrifuge inertia [kgm^2] = $0.5 \times m (r_1^2 + r_2^2)$.

j_M = gear motor inertia [kgm^2].

η_M = gear motor efficiency.

n_1 = maximum motor speed [RPM].

n_2 = maximum centrifuge speed [RPM].

R_b = brake resistor.

6.3 Continuous Braking

To achieve continuous braking, select a brake resistor in which the constant braking power does not exceed the average power P_{avg} of the brake resistor.

NOTICE

Contact the Danfoss distributor for further information.

7 Special Conditions

7.1 Alternative Braking Methods

7.1.1 DC Injection Braking

If the 3-phase winding of the stator is fed with direct current, a stationary magnetic field Φ is set up in the stator bore causing a voltage to be induced in the bars of the cage rotor as long as the rotor is in motion. Since the electrical resistance of the rotor cage is very low, even small induced voltages can create a high rotor current. This current produces a strong braking effect on the bars and hence on the rotor. As the speed decreases, the frequency of the induced voltage decreases and with it the inductive impedance. The ohmic resistance of the rotor gradually becomes dominant and so increases the braking effect as the speed decreases. The braking torque generated decreases steeply just before standstill and finally ceases when there is no further movement. Direct current injection braking is therefore not suitable for holding a load at rest.

7.1.2 AC-braking

When the motor acts as a brake, the DC-link voltage increases because energy is fed back to the DC-link. The principle in AC brake is to increase the magnetization during the braking and thereby increase the thermal losses of the motor.

7.1.3 Mechanical Holding Brake

A mechanical holding brake mounted directly on the motor shaft normally performs static braking. In some applications, the static holding torque is working as static holding of the motor shaft (usually synchronous permanent motors). A holding brake is either controlled by a PLC or directly by a digital output from the frequency converter (relay or solid state).

NOTICE

When the holding brake is included in a safety chain: A frequency converter cannot provide a safe control of a mechanical brake. A redundancy circuitry for the brake control must be included in the total installation.

7.1.4 DC Braking

Resistor brake is useful from maximum speed down to a certain frequency. Below this frequency, DC braking is to be applied as required. The most efficient way of doing this is to use a combination of dynamic braking and DC braking. See *Illustration 7.1*. The parameters are in *chapter 5 Parameters*.

Illustration 7.1 Optimum Braking

How to calculate optimum DC-brake cut in frequency:

$$\text{Slip } s = \frac{n_0 - n_n}{n_0} \times 100 [\%]$$

$$\text{Synchronous speed } n_0 = \frac{f \times 60}{p} [1/\text{min}]$$

f = frequency supplied to motor.

p = number of pole pairs.

n_n = speed of the rotor.

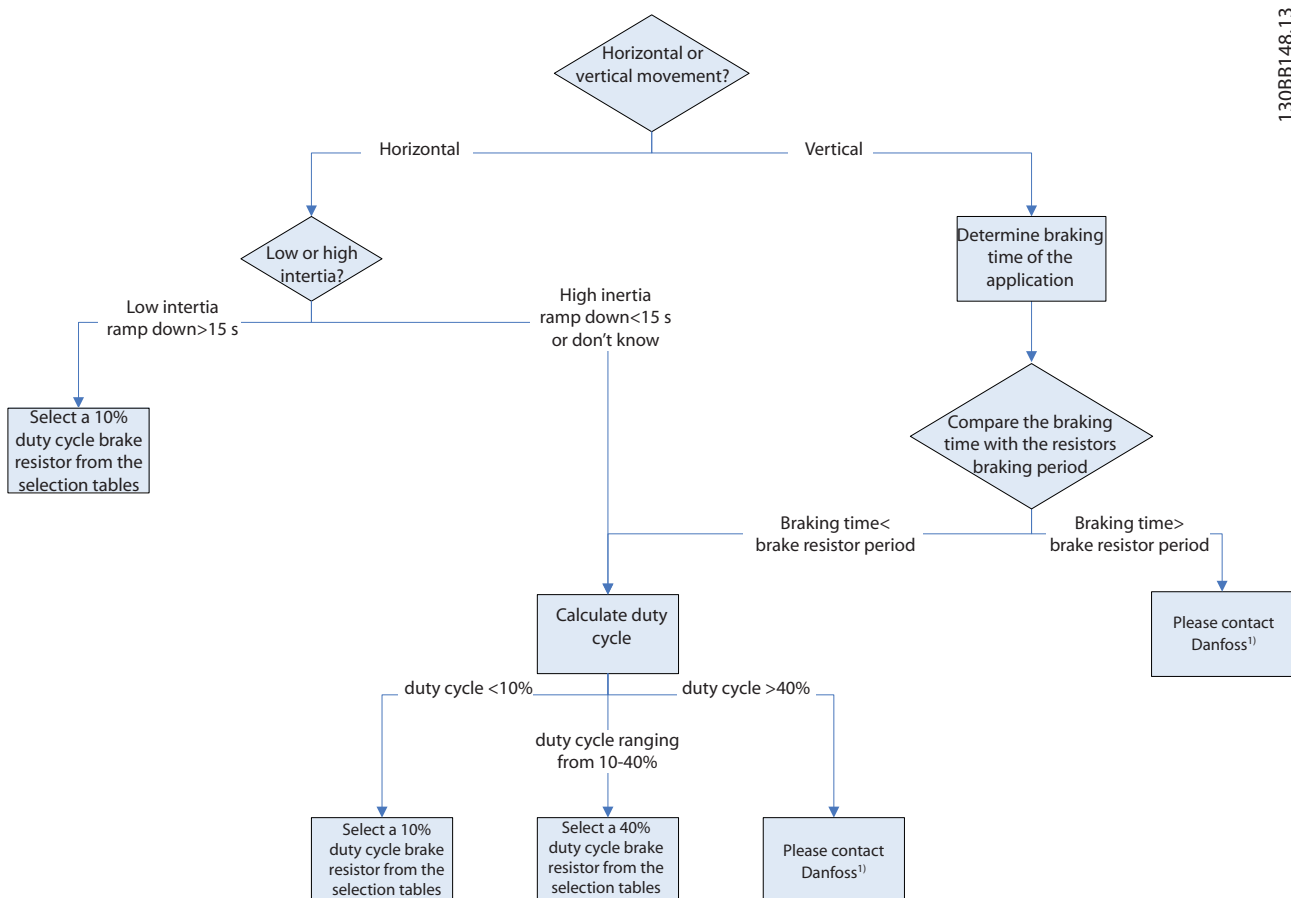

$$\text{DC-brake cut in frequency} = 2 \times \frac{s \times f}{100} [\text{Hz}]$$

8 Selection Guide

8.1 Selection Flow Chart

To select the correct size of brake resistor for an application, refer to the flow chart in *Illustration 8.1*.

1. Select an answer to each question from the top down.
2. Follow the answer to reach the next question, or to obtain guidance in calculating inertia or duty cycle.
3. The final box indicates the correct selection table, or whether to call hotline for additional guidance.

130BB148.13

8

Illustration 8.1 Brake Resistor Selection Flow Chart

1) When contacting Danfoss, provide the following data:

- Nominal power 100%
- Maximum power during brake cycle
- Braking time/duty cycle
- Supply voltage (maximum DC)
- Resistance (Ω)
- With or without temperature switch
- IP enclosure rating
- Type of reference drive

8.2 Selection Tables for Recommended Brake Resistors

8.2.1 Abbreviations used in the Brake Resistor Tables

Mains	Voltage class.
P _m	Rated motor size for frequency converter.
R _{min}	Minimum allowed brake resistor - by frequency converter.
R _{rec}	Recommended brake resistor resistance of Danfoss brake resistors.
Thermo relay	Brake current setting of external thermo relay.
Danfoss part number	Danfoss brake resistor order numbers.
Cable cross-section	Recommended minimum value based upon PVC insulated copper cable. 30 °C (86 °F) ambient temperature with normal heat dissipation.
P _{br,cont.}	Brake resistor average rated power. The temperature switch enables at approximately 90% of continuous rated power at brake resistors with IP54, IP21, and IP65 enclosure protection.
R _{br,nom}	The nominal (calculated) resistor value to ensure a brake power on motor shaft of 150/160/110% for 1 minute.

Table 8.2 T4, Vertical Braking 40% Duty Cycle

9 Specifications

9.1 Ambient Conditions

Environment

Ambient temperature range	-40 to 70 °C (-40 to 158 °F)
Temperature range during storage/transport	-40 to 70 °C (-40 to 158 °F)
Maximum temperature at housing	300 °C (572 °F)
Maximum relative humidity	5–85%, non-condensation during operation
Power derating as a function of ambient temperature. (100% power rating and pulse-load):	
- Steel grid brake resistors, IP20	Continuous power 100% @ 40 °C (104 °F) to 70% @ 70 °C (158 °F), linear
- Aluminum-housed compact brake resistors, IP21	Continuous power 100% @ 40 °C (104 °F) to 75% @ 70 °C (158 °F), linear
- Aluminum-housed brake resistors - compact and flat-pack, IP54	Continuous power 100% @ 40 °C (104 °F) to 75% @ 70 °C (158 °F), linear
- Aluminum compact brake resistors, IP65	Continuous power 100% @ 40 °C (104 °F) to 50% @ 70 °C (158 °F), linear
Power derating at vertical mounted resistor (wall-mounted) when mounted horizontal (100% power rating and pulse-load):	
- Aluminum-housed flat-pack brake resistors, IP54	No derating
- Aluminum-housed compact brake resistors, IP21, IP54, IP65	-20%
Cooling requirements:	
The brake resistors are cooled by free natural convection. The power ratings of the resistors refers to cooling conditions with free natural cooling. The requirements for minimum clearances must be observed during installation.	
Derating at high altitudes	100% @ 1000 m (3281 ft) above sea level
Derating at high altitudes	94% @ 1500 m (4921 ft) above sea level
Derating at high altitudes	82% @ 3000 m (9843 ft) above sea level

9.2 General Electrical Specifications

Electrical specifications

Resistance tolerances	±10%
Insulation	>20 MΩ @ 1000 V
Dielectric strength	2500 V AC for 1 minute
Operating voltage:	
- Aluminum-housed compact brake resistors, IP54	UL: 600 V AC/600 V DC
- Aluminum-housed compact brake resistors, IP54	IEC: 690 V AC/1100 V DC
- Aluminum-housed flat-pack brake resistors, IP54	UL: 1000 V AC/1400 V DC
- Aluminum-housed flat-pack brake resistors, IP54	IEC: 1000 V AC/1400 V DC
- Aluminum-housed compact brake resistors, IP21, IP65	UL: 600 V AC/600 V DC
- Aluminum-housed compact brake resistors, IP21, IP65	IEC: 690 V AC/1100 V DC
- Steel grid brake resistors, IP20	IEC: 690 V AC/1100 V DC
Power rating (continuous load 100%) with and without temperature switch	
- Without temperature switch	100% of continuous power rating @ 40 °C (104 °F)
- With temperature switch, steel grid brake resistors, IP20	100% of continuous power rating @ 40 °C (104 °F)
- With temperature switch, aluminum-housed brake resistors, IP21, IP54, IP65	Minimum 80% of continuous power rating @ 40 °C (104 °F)
- With temperature switch, aluminum-housed brake resistors, IP21, IP54, IP65	Temperature switch enables at ≥80% of the continuous power rating @ 40 °C (104 °F)
Electrical data temperature switch:	
- Steel grid brake resistors, IP20	10 A, 250 V AC, normally closed (NC). Enables at 260 °C (500 °F)
- Aluminum-housed brake resistors, IP21, IP54, IP65	2 A, 250 V AC, normally closed (NC). Enables at 180 °C (356 °F)

Table 9.1 Electrical Data: Product Types 9xx

1) Based on reference profiles with 30 s repetition rates.

2) Temperature switch type 1: 2 A. 250 V AC. Normally closed (NC). Enables at 180 °C (356 °F).

3) Temperature switch type 2: 10 A. 250 V AC. Normally closed (NC). Enables at 260 °C (500 °F).

4) Only for versions with fixed cables. All cables are 1000 mm (39.4 in) unshielded cables.

Index

A

Abbreviations..... 26

AC-braking..... 24

Airflow..... 7

Aluminum-housed compact brake resistor..... 5

Aluminum-housed flat-pack brake resistor..... 5

Ambient conditions..... 28

Application..... 23

Approval..... 4

Average power..... 17

B

Brake cable..... 13

Brake current..... 26

Brake IGBT..... 14

Brake power..... 15

Brake resistor, fixed cable..... 13

Brake system..... 5

Braking power..... 17, 21

C

Cable connection..... 13

Cable cross-section..... 26

Cabling..... 13

Calculation..... 16

CE Conformity..... 4

CE Labeling..... 4

Centrifuge..... 23

Clearance..... 7

Connection cable..... 13

Connection, cable..... 13

Continuous braking..... 23

Conveyor belt..... 21

Cooling..... 7

D

DC braking..... 24

DC-link voltage..... 5, 24

Drives.danfoss.com..... 4

Duty cycle..... 17

E

Electrical installation..... 12

Electrical resistance..... 24

Electrical specification..... 28

EMC precaution..... 12

Enclosure protection class..... 6

Energy dissipation..... 21

Environment..... 28

F

Fixed cable..... 13

Footprint..... 109

Footprint bracket..... 11

H

Holding brake, mechanical..... 24

Horizontal load..... 5

Horizontal mounting..... 7

I

Inertia..... 18

Installation, mechanical..... 7

K

Kinetic energy..... 17

L

L profile..... 107

L profile bracket..... 12

Labeling, CE..... 4

Low Voltage Directive (2014/35/EU)..... 4

M

Mechanical drawing..... 54

Mechanical holding brake..... 24

Mechanical installation..... 7

Mounting, horizontal..... 7

Mounting, vertically..... 7

O

Ohmic resistance..... 24

Optimum braking..... 24

Overtemperature protection..... 13

P

Parameters..... 19

Peak power..... 17

Protection, overtemperature..... 13

Protective function..... 7

R

Resistance, electrical.....	24
Resistance, ohmic.....	24
Resistor time cycle.....	5

S

Safety precaution.....	4
Selection flow chart.....	25
Selection guide.....	25
Steel grid brake resistor.....	5
Surface temperature.....	4

T

Temperature switch.....	13
Thermo relay.....	14
Twisted cable.....	13

V

Vertical load.....	5
Vertically mounting.....	7
