# 1 Overview

1

## 1.1.1 Introduction

The frequency converter control board is program selectable for use with the Johnson Controls Metasys N2 protocol. Metasys N2 is a master/slave control network. The physical layer is RS485 compatible, half duplex 9600 baud shielded twisted pair. The N2 software protocol is designed to be general in nature to accommodate the unique properties each device type may have. Every device connection to the N2 network can be thought of as a small data manager. Data points in the database are classified as analog I/O (floating point), binary I/O or integer data points - floats, integers or bytes. Each data type has its own unique structure defined in the Metasys N2 system Protocol Specification for Vendors.

The information in this manual is intended to provide you with comprehensive information on how to install and set up the frequency converter for communication over a Metasys network.

For specific information on operation of the drive, refer to the *AF-600 FP Operating Instructions*.

## 1.1.2 About this Manual

This manual is for both instructional and for reference purposes. This manual can also serve as a guideline when you specify and optimize your communication system.

It is highly recommended that you read this manual in its entirety before initiating any programming. It is assumed that the user has full knowledge of the capabilities and limitation of the controller node in addition to full knowledge of the frequency converter.

## 1.1.3 References

In addition to this manual, the following two manuals should be consulted: *AF-600 FP Operating Instruction* and *Johnson Controls METASYS N2 System Protocol Specification for Vendors*, Johnson Controls number 04-3402-22, rev A.

## 2 Instructions

### 2.1.1 Abbreviations and Definitions

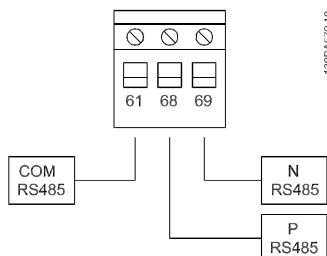

#### Abbreviations and definitions

ACK	Acknowledge
ADF	Internal Floating Points
ADI	Internal Integers
AI	Analog Inputs
AO	Analog Outputs
BI	Binary Inputs
BO	Binary Outputs
COS	Change Of State
HPFB	High Performance Field Network
JCI	Johnson Controls Inc. developers of the METASYS N2 protocol
N2	METASYS N2
N2 master	A N2 master is either a PC with JCI software or a dedicated JCI controller
NAK	Not acknowledged
NPA	N2 Point Address (Each N2 Point Type has a address range from 0 to 255)
NPT	N2 Point Type
PAR	Parameter Number

### 2.1.2 Network Connection

Connect signal wires to terminal 68 (N+) and terminal 69 (N-) on main control board of the drive. If shielded cabling is used, connect one end of the shield to terminal 61. This terminal is connected to ground via an internal RC link. It is highly recommended to use twisted-pair cables to reduce the differential mode interference between the conductors

Torque Specifications:	4.5 in.lb. (0.5 Nm)
Control wire:	18 - 24 AWG, shielded, twisted pair

### 2.1.3 Hardware Set-up

RS485 Network Connection:

One or more frequency converters can be connected to a control (or master) using the RS485 standardized interface. Terminal 68 is connected to the P signal (TX+, RX+), while terminal 69 is connected to the N signal (TX-, RX-). If more than one frequency converter is connected to a master, use parallel connections.

2

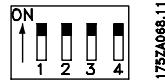

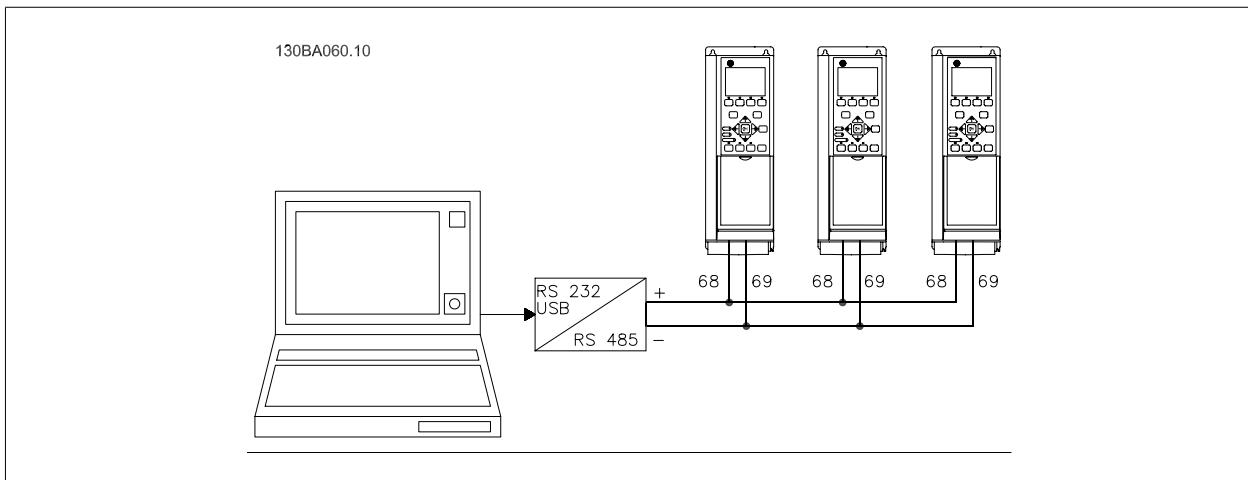

Illustration 2.1: Network termination switch

In order to avoid potential equalizing currents in the screen, earth the cable screen via terminal 61, which is connected to the frame via an RC-link.

Network termination: The RS485 network must be terminated by a resistor network at both ends. For this purpose, set switch S801 on the control card to "ON". For more information, see the paragraph: Switches S201, S202 and S801.

**NB!**

Communication protocol must be set to Drive MC par. O-30.

## 2.1.4 Error Codes

### Error codes

Error Code 00	is issued after power up or after a time out where all overridden points were released, as long as no identify yourself command has been issued by the master.
Error Code 01	is issued if the command is not supported or not known by the drive.
Error Code 02	is issued if the received message has a checksum error.
Error Code 03	is issued if the N2 message receive buffer exceeds 256 characters.
Error Code 05	is issued if the received N2 message is too long.
Error Code 10	is issued the data is out of expected range
Error Code 11	is issued when: <ol style="list-style-type: none"><li>1. A point attributes or attribute bit is unused.</li><li>2. A point attributes or attribute bit is for JCI use only.</li><li>3. An internal data point attribute for current value can not be changed while running</li></ol>
Error Code 12	is issued when: <ol style="list-style-type: none"><li>1. The N2 master tries to change attribute 2 bit 6 "Current State" on a BO and the drive is tripped.</li><li>2. The N2 master tries to change attribute 2 bit 6 "Current State" on a BO and the drive is trip locked except for BO 5 "reset"</li></ol>

## 2.1.5 Drive Parameters

The following parameters may need to be manually set for each drive in the Metasys N2 network. Refer to the Installation, Operation and Maintenance Manual for the frequency converter for programming.

### Parameter list

DRIVEPARAMETER	DESCRIPTION	DEFAULT	DESIRED SETTING
O-01	Control Side	Digital & Ctrl. Word	
O-02	Control Source	Drive Port	Drive Port
O-03	Control Word Timeout	60 s	1-18000 s
O-30	Protocol	Drive	Metasys N2
O-31	Address	1	1-255
O-32	Drive Port Baud Rate	9600	Fixed to 9600
O-33	Drive Port Parity	Even, 1stop	Fixed to No Parity, 1stop
O-37	Maximum Inter-char Delay		25 s for Metasys N2

### 2.1.6 General Commands (Acknowledged)

DRIVE Response	Command	Subcommand	NPA Object no.	Attribute Message Type	Error Code	Comments
ACK	0	4	-	Poll Message No Acknowledge	-	The slave is to respond with any data points, analog or binary I/O that have been flagged for COS
ACK	0	5	-	Poll message With Acknowledge	-	The slave is to respond with any data points, analog or binary I/O that have been flagged for COS
ACK	0	9	-	Status update Message	-	Slave device must respond with device manufacturing model number [Par. AN-21], days in service [Par. AN-00] and device status
ACK	F	-	-	Identify Device Type	-	Slave device responds with an identification number of 10H to indicate non JCI device
ACK	0	0	-	Synch Time	-	The internal clock is synchronized by this command
ACK, no action	8	0	-	Upload	-	Optional, no support in the frequency converter
ACK, no action	8	1	-	Upload	-	Optional, no support in the frequency converter
ACK, no action	8	3	-	Upload Record	-	Optional, no support in the frequency converter
ACK, no action	8	4	-	Upload Complete	-	Optional, no support in the frequency converter
ACK, no action	9	0	-	Download	-	Optional, no support in the frequency converter
ACK, no action	9	1	-	Download	-	Optional, no support in the frequency converter
ACK, no action	9	3	-	Download	-	Record optional, no support in the frequency converter
ACK, no action	9	4	-	Download Complete	-	Optional, no support in the frequency converter
NAK	0	1	-	Read Memory	01	Slave device memory read based on memory addresses
NAK	0	8	-	Warm Start	01	JCI use only

Table 2.1: No Region, Attribute Number and -type in this table.

## 2.1.7 Analog Input Commands (Acknowledged)

DRIVE Response	Command	Subcommand	Region	NPA Object no.	Attribute No.	Attribute Message Type	Comments
ACK	1	-	1	0-23	1	Byte	Read Analog Input Read Object Configuration attribute associated with each individual point
ACK	1	-	1	0-23	2	Byte	Read Analog Input <sup>1)</sup> Read Object Status attribute associated with each individual point
ACK	1	-	1	0-23	3	Float	Read Analog Input <sup>2)</sup> Read Analog Input Value attribute associated with each individual point
ACK	1	-	1	0-23	8	Float	Read Low Alarm attribute associated with each individual point
ACK	1	-	1	0-23	9	Float	Read Low Warning attribute associated with each individual point
ACK	1	-	1	0-23	10	Float	Read High Warning attribute associated with each individual point
ACK	1	-	1	0-23	11	Float	Read High Alarm attribute associated with each individual point
ACK	1	-	1	0-23	12	Float	Read Differential attribute associated with each individual point
ACK	2	-	1	0-23	1	Byte	Write to Object Configuration attribute associated with each individual point
ACK	2	-	1	0-23	8	Float	Write Analog Input Write to Low Alarm Limit attribute associated with each individual point
ACK	2	-	1	0-23	9	Float	Write Analog Input Write to Low Warning Limit attribute associated with each individual point
ACK	2	-	1	0-23	10	Float	Write Analog Input Write to High Warning Limit attribute associated with each individual point
ACK	2	-	1	0-23	11	Float	Write Analog Input Write to High Alarm Limit attribute associated with each individual point
ACK	2	-	1	0-23	12	Float	Write Analog Input Write to Differential attribute associated with each individual point
ACK, no action	7	2	1	0-23	-	Float	Override Analog inputs Analog inputs are "outputs" from the frequency converter and should not be written over by the network controller
ACK, no action	7	3	1	0-23	-	-	Override Analog Release Analog inputs are "outputs" from the frequency converter and should not be written over by the network controller
ACK, no action	7	7	1	0-23	-	-	Write Analog Input Attributes Optional command for slave devices. Only used for N2 commissioning purposes

Table 2.2: No Error code in this table.

### 2.1.8 Analog Input Commands (Not Acknowledged)

DRIVE Response	Com-mand	Region	NPA Object no.	Attribu-te No.	Attribute Message Type		Error Code	Comments
NAK	1	1	0-23	4	Float	Read Analog Input	11 <sup>1)</sup>	Read Linear Ranging Parameter 1 attribute associated with each individual point. (JCI use only)
NAK	1	1	0-23	5	Float	Read Analog Input	11 <sup>1)</sup>	Read Linear Ranging Parameter 2 attribute associated with each individual point. (JCI use only)
NAK	2	-	0-23	2	Byte	Write Analog Input	11 <sup>1)</sup>	Object Status writeable
NAK	2	-	0-23	3	Float	Write Analog Input	11 <sup>1)</sup>	Analog Input Value not writeable
NAK	2	-	0-23	4	Float	Write Analog Input	11 <sup>1)</sup>	Write to Linear Ranging Parameter 1 attribute associated with each individual point. (JCI use only)
NAK	2	-	0-23	5	Float	Write Analog Input	11 <sup>1)</sup>	Write to Linear Ranging Parameter 2 attribute associated with each individual point. (JCI use only)
NAK	2	-	0-23	6	Float	Write Analog Input	11 <sup>1)</sup>	Write to Linear Ranging Parameter 3 attribute associated with each individual point. (JCI use only)
NAK	2	-	0-23	7	Float	Write Analog Input	11 <sup>1)</sup>	Write to Linear Ranging Parameter 4 attribute associated with each individual point. (JCI use only)
NAK	2	-	0-23	13	Integer	Write Analog Input	11 <sup>1)</sup>	Write to Filter Weight attribute associated with each individual point. (JCI use only)
NAK	2	-	0-23	14	Float	Write Analog Input	11 <sup>1)</sup>	Write to AI Offset attribute associated with each individual point. (JCI use only)

<sup>1)</sup> Error code 11 is used because attributes are considered as fields/records in the point map database.

Table 2.3: No Subcommand column in this table.

### 2.1.9 Analog Output Commands (Acknowledged)

DRIVE Response	Command	Sub command	Region	NPA Object no.	Attribute No.	Attribute Message Type		Comments
ACK	1	-	3	0-2	1	Byte	Read Analog Output	Read Object Configuration attribute associated with each individual point
ACK	1	-	3	0-2	2	Byte	Read Analog Output	Read Object Status attribute associated with each individual point
ACK	0	9	-	-	-	-	Status update Message	Slave device must respond with device manufacturing model number (Par. AN-21), days in service (Par. AN-00) and device status
ACK	1	-	3	0-2	3	Float	Read Analog Output	Read Current Value attribute associated with each individual point
ACK	2	-	3	0-2	1	Byte	Write Analog Output	Write to Object Configuration attribute associated with each individual point
ACK	7	2	3	0-2	-	Float	Override Analog Output	Write to analog output current value (frequency setpoint)
ACK	7	2	3	0-2	-	Float	Override Analog Output	Write to analog output current value (frequency setpoint)
ACK	7	3	3	0-2	-	-	Override Release	Set the current value, the value that it was before the 1. Override Command was issued
ACK, no action	7	7	3	0-2	-	-	Write Analog Output	Optional command for slave devices. Only used for N2 Attributes commissioning purposes. Not to be implemented at this time
ACK, no action	7	8	3	0-2	-	-	Read Analog Output Attributes	Optional command for no action slave devices. Only used for N2 commissioning purposes. Not to be implemented at this time

Table 2.4: No Error Code column in this table.

### 2.1.10 Analog Output Commands (Not Acknowledged)

DRIVE Response	Command	Region	NPA Object no.	Attribute No.	Attribute Message Type		Error Code	Comments
0-2	1	3	0-2	4	Float	Read Analog Output	11 <sup>1</sup>	Read Low Linear Ranging Parameter attribute associated with each individual point. (JCI use only)
NAK	1	3	0-2	5	Float	Read Analog Output	11 <sup>1</sup>	Read High Linear Ranging Parameter attribute associated with each individual point. (JCI use only)
NAK	2	3	0-2	2	Byte	Write Analog Output	11 <sup>1</sup>	Object Status not writeable
NAK	2	3	0-2	3	Float	Write Analog Output	11 <sup>1</sup>	Write to Current Value structure attributes associated with each individual point. (N2 does not support this, override function must be used)
NAK	2	3	0-2	4	Float	Write Analog Output	11 <sup>1</sup>	Write Debouncing Value in msec attribute associated with each individual point.(JCI use only)
NAK	2	3	0-2	5	Float	Write Analog Output	11 <sup>1</sup>	Write Accumulator value attribute associated with each individual point. (JCI use only)

<sup>1)</sup> Error code 11 is used because attributes are considered as fields/records in the point map database.

Table 2.5: No Subcommand column in this table.

### 2.1.11 Binary Input (BI) Commands (Acknowledged)

DRIVE Response	Command	Subcom-mand	Region	NPA Object no.	Attribute No.	Attribute Message Type		Comments
ACK	1	-	2	0-135	1	Byte	Read Binary In-put	Read Object Configuration at-tribute associated with each individual point
ACK	1	-	2	0-135	2	Byte	Read Binary In-put	Read Object Status attribute associated with each individual point
ACK	2	-	2	0-135	1	Byte	Write Binary In-put	Write to Object Configuration at-tribute associated with each individual point
ACK, no action	7	2	2	0-135	-	Byte(0/1)	Override Binary Input	Binary inputs are "outputs" from the frequency converter and should not be written over by the network controller. (Status word, Warnings, and Alarms)
ACK, no action	7	3	2	0-135	-	-	OverrideRelease	Binary inputs are "outputs" from the drive and should not be writ-ten over by the network controller. (Status word, Warnings and Alarms)
ACK, no action	7	7	2	0-135	-	-	Write Binary In-put	Optional command for slave de-vices. Only Attributes used for N2 commissioning purposes. Not to be implemented at this time
ACK, no action	7	8	2	0-135	-	-	Read Binary In-put	Optional command for Attrib-utes slave devices. Only used for N2 commissioning purposes. Not to be implemented at this time

### 2.1.12 Binary Input (BI) Commands (Not Acknowledged)

DRIVE Response	Command	Region	NPA Object no.	Attribute No.	Attribute Message Type		Error Code	Comments
NAK	2	2	0-135	2	Byte	Write Binary In-put	11 <sup>1</sup>	Object Status not writeable
NAK	2	2	0-135	3	Integer	Write Binary In-put	11 <sup>1</sup>	Write Debouncing Value in msec at-tribute associated with each individual point.(JCI use only)
NAK	2	2	0-135	4	Inte-ger32	Write Binary In-put	11 <sup>1</sup>	Write Accumulator value attribute associated with each individual point (JCI use only)

Table 2.6: No Subcommand coloumn in this table.

### 2.1.13 Binary Output Commands (Acknowledged)

DRIVE Response	Command	Subcom- mand	Region	NPA Object no.	Attribute No.	Attribute Message Type		Comments
ACK	1	-	4	0-10	1	Byte	Read Binary Output	Read structure attributes associated with each individual point
ACK	1	-	4	0-10	2	Byte	Read Binary Output	Read structure attributes associated with each individual point
ACK	2	-	4	0-10	1	Byte	Write Binary Output	Write to Object Configuration attribute associated with each individual point
ACK	7	2	4	0-10	-	Byte(0/1)	Override Binary Output	Write to binary output current state (Drive control word)
ACK	7	2	4	0-10	-	Byte(0/1)	Override Binary Output	Write to binary output current state (Drive control word)
ACK	7	3	4	0-10	-	-	Override Release	Set the current value, the value that it was before the 1. Override Command was issued
ACK, no action	1	-	4	0-10	3	Integer	Read Binary Output	Read Minimum On-time attribute associated with each individual point. Return value = 0
ACK, no action	1	-	4	0-10	4	Integer	Read Binary Output	Read Minimum Off-time attribute associated with each individual point. Return value = 0
ACK, no action	1	-	4	0-10	5	Integer	Read Binary Output	Read Maximum Cycles/ Hour attribute associated with each individual point. Return value = 0
ACK, no action	2	-	4	0-10	3	Integer	Write Binary Output	Write Minimum On-time attribute associated with each individual point
ACK, no action	2	-	4	0-10	4	Integer	Write Binary Output	Write Minimum Off-time attribute associated with each individual point
ACK, no action	2	-	4	0-10	5	Integer	Write Binary Output	Write Maximum Cycles/ Hour attribute associated with each individual point
ACK, no action	7	7	4	0-10	-	-	Write Binary Output	Optional command for slave devices. Only Attributes used for N2 commissioning purposes
ACK, no action	7	8	4	0-10	-	-	Read Binary Output	Optional command for slave devices. Only Attributes used for N2 commissioning purposes

Table 2.7: No Error Code column in this table.

### 2.1.14 Binary Output (BO) Commands (Not Acknowledged)

DRIVE Response	Command	Region	NPA Object no.	Attribute No.	Attribute Message Type		Error Code	Comments
NAK	1	4	0-10	6	Integer	Read Binary Output	11 <sup>1)</sup>	Read Interstage on delay attribute associated with each individual point. (JCI use only)
NAK	1	4	0-10	7	Integer	Read Binary Output	11 <sup>1)</sup>	Read Interstage off delay attribute associated with each individual point. (JCI use only)
NAK	2	4	0-10	2	Byte	Write Binary Output	11 <sup>1)</sup>	Object Status not writeable
NAK	2	4	0-10	6	Integer	Write Binary Output	11 <sup>1)</sup>	Write Interstage on delay attribute associated with each individual point. (JCI use only)
NAK	2	4	0-10	7	Integer	Write Binary Output	11 <sup>1)</sup>	Write Interstage off delay attribute associated with each individual point. (JCI use only)

<sup>1)</sup> Error code 11 is used because attributes are considered as fields/records in the point map database.

Table 2.8: No Subcommand column in this table.

### 2.1.15 Internal Integers (ADI) Commands (Acknowledged)

DRIVE Response	Command	Subcom-mand	Region	NPA Object no.	Attribute No.	Attribute Message Type		Comments
ACK	1	-	6	0-254	1	Integer	Read Internal Parameter of object type integer (16 bit)	Read Object Status associated with each individual point
ACK	1	-	6	0-254	2	Integer	Read Internal Parameter of object type integer (16bit)	Read Current Value attribute associated with each individual point
ACK	2	-	6	0-254	-	Integer	Write Internal Parameter of object type integer (16bit)	Write to Current Value attribute associated with each individual point
ACK	7	2	6	0-254	-	Integer	Override Internal Parameter of object type Integer (16 bit)	Write to internal parameter current value (set-up parameters for Drive)
ACK	7	3	6	0-254	-	-	Override Release	Set the current value, the value that it was before the 1. Override Command was issued

Table 2.9: No Error Code column in this table.

### 2.1.16 Internal Floating Point Commands (Acknowledged)

DRIVE Response	Command	Subcom-mand	Region	NPA Object no.	Attribute No.	Attribute Message Type		Comments
ACK	1	-	5	0-101	1	Byte	Read Internal Parameter of object type float	Read Object Status associated with each individual point
ACK	1	-	5	0-101	2	Float	Read Internal Parameter of object type float	Read Current Value attribute associated with each individual point
ACK	2	-	5	0-101	-	Float	Write Internal Parameter of object type float	Write to Current Value attribute associated with each individual point
ACK	2	-	5	0-101	-	Float	Write Internal Parameter of object type float	Write to Current Value attribute associated with each individual point
ACK	7	2	5	0-101	-	Float	Override Internal Parameter of object type float	Write to internal parameter current value (set-up parameters for Drive)
ACK	7	3	5	0-101	-	-	Override Release	Set the current value, the value that it was before the 1. Override Command was issued

Table 2.10: No Error Code column in this table.

## 2.2.1 Start-up of the Frequency Converter

Use the frequency converter keypad mounted either on the drive or remote. Use the Extended Menu key to access the O-## group parameters (Options / Comms). The settings shown below are typical. Some settings may be changed to meet the application requirements. The settings below will serve as a good starting reference. Refer to the operating instruction manual for instructions on changing parameters and programming the drive.

Examples of typical settings. Program the following:

Parameter:	Setting:
par. O-30 Protocol	[3] Metasys N2
par. O-31 Address	1 (Default)
par. O-32 Drive Port Baud Rate	[2] 9600 Baud (fixed at 9600 for N2 protocol)
par. O-50 Coasting Select	[3] Logic OR
par. O-52 DC Brake Select	[3] Logic OR
par. O-53 Start Select	[3] Logic OR
par. O-54 Reversing Select	[0] Digital input
par. O-55 Set-up Select	[3] Logic OR
par. O-56 Preset Reference Select	[3] Logic OR
par. O-94 Bus Feedback 1	0
par. O-95 Bus Feedback 2	0

**NB!**

Send an F command to begin communications between the master and the drive!

**Example 1:**

F command	Setting:
Device address	XX
Char1 command	F
Checksum	YY

**Message code:**

>XXFY<CR>

Issue a run command through the master, to the device:

**Example 2:**

Network start, BO override command:	Setting:
Device address	XX
Char1 command	7
Char1 subcommand	2
Char2 region	04
Char2 object number (NPA)	04 (Start)
Char2 override value	01 (Active)
Checksum	YY

**Message code:**

>XX72040401YY<CR>

Issue a frequency reference through the master, to the device:

**Example 3:**

Over-ride analog output, speed (50%) change command:		Setting:
Device address	XX	
Char1 command	7	
Char1 subcommand	2	
Char2 region	03	
Char2 object number (NPA)	00	
Char8 override value *	4E 00 00 00 override value = 50% speed (IEEE floating point, format)	
Checksum	YY	

**Message code:**

&gt;XX7203004E000000&lt;CR&gt;

To calculate override value for speed: refer to Scaling of Network Reference and Network Feedback. Issue an override release command through the master to the device:

**Example 4:**

Bus stop, BO over-ride release command:		Setting:
Device address	XX	
Char1 command	7	
Char1 subcommand	2	
Char2 region	04	
Char2 object number (NPA)	04 (Start)	
Char8 override value *	00 (Not active)	
Checksum	Y	

**Message code:**

&gt;XX72040400YY &lt;CR&gt;

If the preceding commands were issued, the drive should have accelerated to 50% after the speed reference was issued. After the override release, the drive should have stopped.

## 2.2.2 Scaling of Bus Reference and Feedback

Reference/feedback	Scaling	Float	IEEX hex
20%	20 * 16384/100	3276.8	454C CCCD
50%	50 * 16384/100	8192	4600 0000
100%	100 * 16384/100	16384	4680 0000
200%	200 * 16384/100	32767	46FF FE00
-100%	-100 * 16384/100	-16384	C680 0000
-200%	-200 * 16384/100	-32768	C700 0000

Table 2.11: Reference/feedback values

The reference/feedback value is the percentage of the range of parameter F-52 and F-53. Values within the ranges 100% to 200% and -200% to -100% applies only to the reference. The Float representation of the value 200% must be limited to maximum 32767 and minimum -32768.

### 2.2.3 Status Update Request

A Status Update Request will cause the drive to report its current operating status. The status codes, descriptions and associated alarms are shown in the chart below.

2

The Device Status Code consists of two parts. The Least Significant Byte, (LSB) of the hex number is the Alarm Number. The Most Significant Byte (MSB) indicates if the alarm is a normal trip (01) that can be reset automatically or manually, or if the alarm is a trip lock (02) requiring cycling power to the drive.

#### Status codes with associated alarms and descriptions

Device Status Code1	Alarm No.	Description
0x0000	-	Device OK
0x0102	2	Live zero error
0x0204	4	Phase fault (Trip lock)
0x0107	7	Over voltage
0x0108	8	Under voltage
0x0109	9	Inverter overloaded
0x010A	10	Motor overloaded
0x010B	11	Motor thermistor
0x010C	12	Current limit
0x020D	13	Over current (Trip lock)
0x020E	14	Earth fault (Trip lock)
0x020F	15	Switch mode fault (Trip lock)
0x0210	16	Short circuit (Trip lock)
0x0111	17	Standard bus time out
0x0112	18	HPFB time out
0x0116	22	Auto optimization not OK
0x021D	29	Heat sink temperature to high (Trip lock)
0x011E	30	Motor phase U missing
0x011F	31	Motor phase V missing
0x0120	32	Motor phase W missing
0x0122	34	Profibus communication error
0x0225	37	Inverter fault (Trip lock)
0x013C	60	Safety interlock
0x0263	99	Unknown fault (Trip lock)

#### Read / Write Notes

A write command to an ADF (Internal Floating Point) or BD (Internal Byte) point type will be stored in the drive's EEPROM.

**NB!**

If write command is issued to an overridden point, the new value will not be stored in the drive's EEPROM.

## 2.2.4 Override/Override Release Commands and Time Out, O-04 (Setting [20], N2 Override release)

The way the overridden points are released is very important to the way the drive will behave during the override release time out or for release commands issued by the N2 master. This is due to the fact that the active setup can be changed to a different setup. If one would release the active setup before the values that have been overridden in that setup, the backup values would then be restored to the wrong setup, leaving the overridden values in the old setup unchanged.

### The release after override time out:

During an override release time-out, all points which are overridden, will be released in the order, which they are specified in Appendix POINTMAP:

1. Release Analog Outputs from point address (NPA) 0 to 255.
2. Release Binary Outputs from point address (NPA) 0 to 255.
3. Release Internal Floating Points from point address (NPA) 0 to 255.
4. Release Internal Integer Points from point address (NPA) 0 to 255.
5. Release Internal Byte points from point address (NPA) 0 to 255.

## 2.2.5 Change of State (COS)/POLLING

A change of state occurs when a new command has been issued for the drive. This command can be issued through the bus or through a drive related status change or command. The master can issue a series of poll commands to the network devices to get an update on any status changes from the time of the last polling. When polling a frequency converter for the first time after a network has been powered up after an F command has been issued, a 0/4 poll command must be issued.

## 2.2.6 Handling of Poll Message Commands

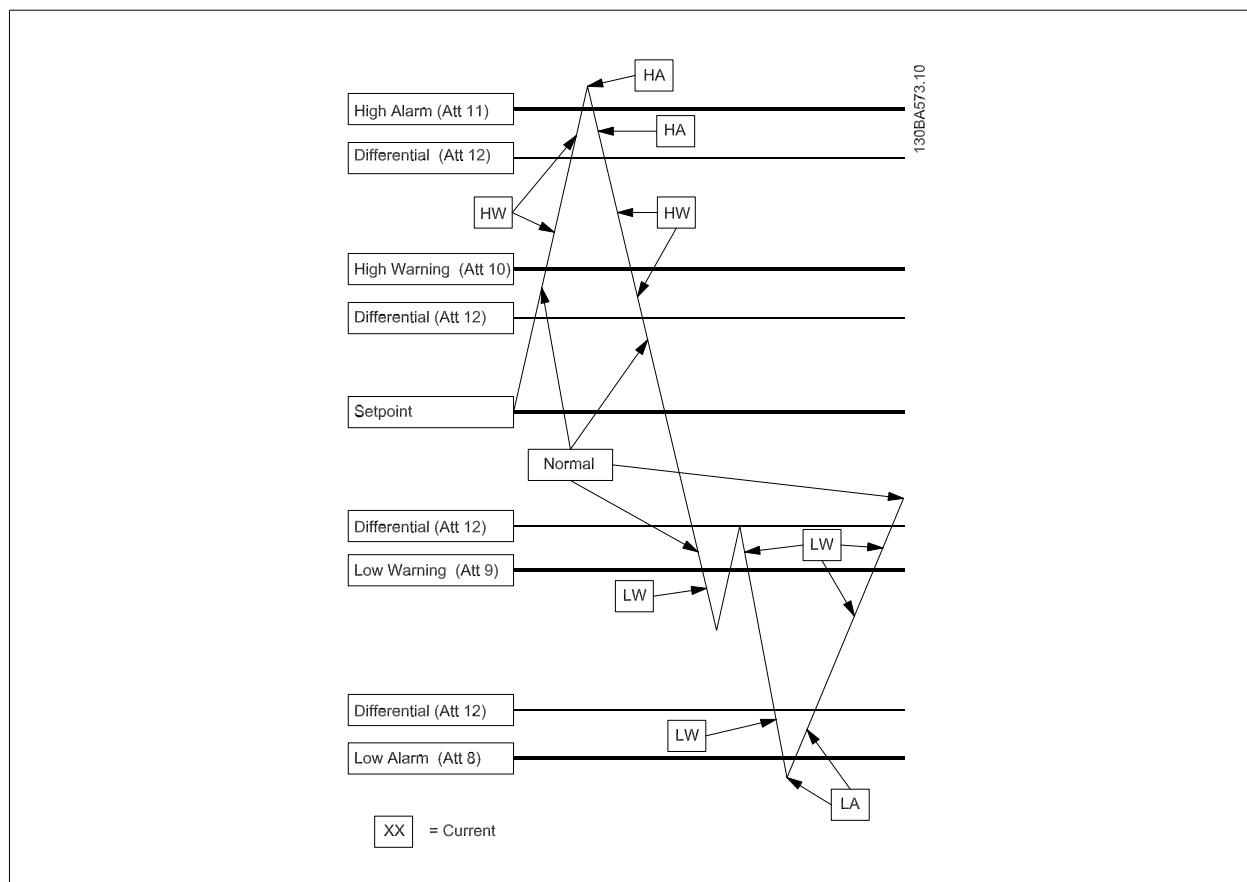

The Identity Command will cause the drive to report all AI, AO, BI and BO points, which are available when the next Poll (0/4) is received. The drive also supports COS for AI and BI point types. The drive is limited to responding with up to 200 ASCII characters, so multiple messages may need to be sent before all available points have been reported.

Upon receiving the Poll (0/4), the frequency converter will begin exporting the requested information. The frequency converter will continue to export new information upon receiving the 0/5 Poll until it has sent all requested information. Then it will respond to a new 0/5 Poll with an ACK response to indicate all information has been transmitted and complete the Poll sequence receiving a 0/4 Poll before sending the ACK response will cause the frequency converter to re-transmit its latest response.

The drawing below illustrates the AI COS handling.

2

**For AI:**

Alarm Enable or Warning Enable must be set in the Object Configuration Attribute (Attribute 1). Low/High Alarm limits (Attribute 8, 11) or Low/High Warning limits (Attribute 9, 10) must be programmed. Differential Value (Attribute 12) must also be programmed.

**For BI:**

Alarm Enable must be set in the Object Configuration Attribute (Attribute 1).

Normal state must be programmed in the Object Configuration Attribute (Attribute 1)

Att XX = Attribute number, HA = High alarm, LA = Low alarm, HW = High Warning, LW = Low Warning

The AI COS alarms will only be cleared when the point value goes below the high alarm/warning or above the low alarm/warning limit by more than the programmed differential value (Attribute 12).

The BI COS will set the Alarm (Object Status bit 4) if COS enabled (Object Configuration Bit 0) is set, Alarm Enabled (Object configuration bit 3) is set, and Current State (Object Status bit 6) is different from Normal State (Object Configuration bit 1).

The default values are shown in bold on the following pages. Any point not listed on the following pages is reserved for future use.

Some Metasys software uses an object number range from 0 to 255, other Metasys software uses the range 1 to 254. The latter software will interpret object number 0 as 1, and 1 as 2, etc. To access the proper point with this Metasys software, add 1 to the NPA number in the tables.

<sup>1</sup> "Feedback" if closed loop - and "100 Hz" if open loop

<sup>2</sup> Unit is power dependent

<sup>3</sup> The drive must be stopped to change this point

<sup>4</sup> The point is global in all 4 setups

<sup>5</sup> Not available in all units.
