1 How to Read these Operating Instructions

1.1.1 How to Read these Operating Instructions

The frequency converter is designed to provide high shaft performance on electrical motors. Please read this manual carefully for proper use. Incorrect handling of the frequency converter may cause improper operation of the frequency converter or related equipment, shorten lifetime or cause other troubles.

These Operating Instructions will help you get started, install, program, and troubleshoot your frequency converter.

Chapter 1, **How to Read these Operating Instructions**, introduces the manual and informs you about the approvals, symbols, and abbreviations used in this literature.

Chapter 2, **Safety Instructions and General Warnings**, entails instructions on how to handle the frequency converter correctly.

Chapter 3, **How to Install**, guides through mechanical and technical installation.

Chapter 4, **How to Programme**, shows how to operate and programme the frequency converter via the Keypad.

Chapter 5, **General Specifications**, contains technical data about the frequency converter.

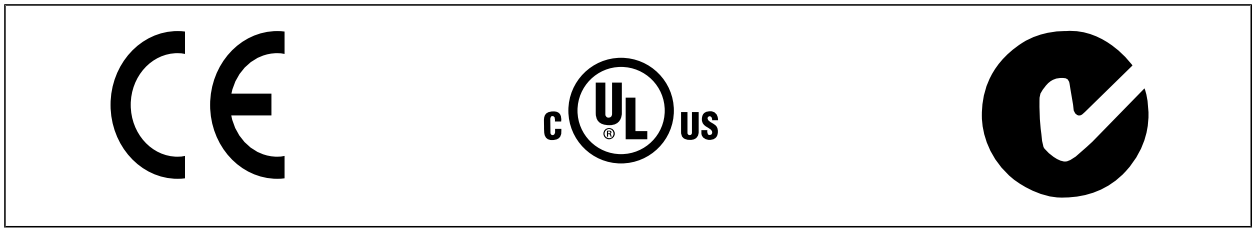
Chapter 6, **Warnings and Alarms**, assists in solving problems that may occur when using the frequency converter.

Available literature for AF-650 GP

- The AF-650 GP Operating Instructions - High Power, provide the necessary information for getting the drive up and running.
- The AF-650 GP Design Guide entails all technical information about the drive and customer design and applications.
- The AF-650 GP Programming Guide provides information on how to programme and includes complete parameter descriptions.
- The AF-650 GP Profibus Operating Instructions provide the information required for controlling, monitoring and programming the drive via a Profibus network.
- The AF-650 GP DeviceNet Operating Instructions provide the information required for controlling, monitoring and programming the drive via a DeviceNet network.
- The AF-650 GP Ethernet/IP Operating Instructions provide the information required for controlling, monitoring and programming the drive via a Ethernet/IP network.
- The AF-650 GP Modbus TCP Operating Instructions provide the information required for controlling, monitoring and programming the drive via a Modbus TCP network.

GE technical literature is also available online at www.geelectrical.com/drives.

1.1.2 Approvals



1.1.3 Symbols

Symbols used in this Operating Instructions.

NB!
Indicates something to be noted by the reader.

Indicates a general warning.

Indicates a high-voltage warning.

* Indicates default setting

2 Safety Instructions and General Warning

2.1 Safety Regulations AF-650 GP

2.1.1 Disposal Instruction

Equipment containing electrical components may not be disposed of together with domestic waste. It must be separately collected with electrical and electronic waste according to local and currently valid legislation.

Caution

The frequency converter DC link capacitors remain charged after power has been disconnected. To avoid electrical shock hazard, disconnect the frequency converter from the mains before carrying out maintenance. Before doing service on the frequency converter wait at least the amount of time indicated below:

380 - 480V	90 - 200 kW	20 minutes
	250 - 800 kW	40 minutes
525 - 690 V	37 - 315 kW	20 minutes
	355 - 1200 kW	30 minutes

AF-650 GP

Operating Instructions

Software version: 2.1x

These Operating Instructions can be used for all AF-650 GP frequency converters with software version 2.1x.
The software version number can be seen from par. ID-43 *Software Version*.

2.1.2 High Voltage

The voltage of the frequency converter is dangerous whenever the frequency converter is connected to mains. Incorrect installation or operation of the motor or frequency converter may cause damage to the equipment, serious personal injury or death. The instructions in this manual must consequently be observed, as well as applicable local and national rules and safety regulations.

Installation in high altitudes

380 - 480 V: At altitudes above 3 km, please contact GE regarding PELV.
525 - 690 V: At altitudes above 2 km, please contact GE regarding PELV.

2.1.3 Safety Instructions

- Make sure the frequency converter is properly connected to earth.
- Protect users against supply voltage.
- Protect the motor against overloading according to national and local regulations.
- Motor overload protection is not included in the default settings. To add this function, set par. F-10 *Electronic Overload* to value *Elec. OL trip* or *Elec. OL warning*. For the North American market: Electronic Thermal Overload functions provide class 20 motor overload protection, in accordance with NEC.
- The earth leakage current exceeds 3.5 mA.
- The [OFF] key is not a safety switch. It does not disconnect the frequency converter from mains.

2.1.4 General Warning

Warning:
Touching the electrical parts may be fatal - even after the equipment has been disconnected from mains.
Also make sure that other voltage inputs have been disconnected, such as load-sharing (linkage of DC intermediate circuit), as well as the motor connection for kinetic back-up.
When using the frequency converter: wait at least 40 minutes.
Shorter time is allowed only if indicated on the nameplate for the specific unit.

Leakage Current
The earth leakage current from the frequency converter exceeds 3.5 mA. To ensure that the earth cable has a good mechanical connection to the earth connection (terminal 95), the cable cross section must be at least 10 mm^2 or 2 rated earth wires terminated separately. For proper earthing for EMC, see section *Earthing* in the *How to Install* chapter.

Residual Current Device
The drive can cause a D.C. current in the protective conductor. Where a residual current device (RCD) is used for extra protection, only an RCD of Type B (time delayed) shall be used on the supply side of this product.
Protective earthing of the frequency converter and the use of RCD's must always follow national and local regulations.

2.1.5 Before Commencing Repair Work

1. Disconnect the frequency converter from mains
2. Disconnect DC bus terminals 88 and 89 from load share applications
3. Wait for discharge of the DC-link. See period of time on the warning label
4. Remove motor cable

2.1.6 Avoid Unintended Start

While the frequency converter is connected to mains, the motor can be started/stopped using digital commands, bus commands, references or via the keypad::

- Disconnect the frequency converter from mains whenever personal safety considerations make it necessary to avoid unintended start.
- To avoid unintended start, always activate the [OFF] key before changing parameters.
- An electronic fault, temporary overload, a fault in the mains supply, or lost motor connection may cause a stopped motor to start. The frequency converter with Safe Stop provides protection against unintended start, if the Safe Stop Terminal 37 is deactivated or disconnected.

2.1.7 Safe Stop

The AF-650 GP can perform the safety function *Safe Torque Off* (As defined by draft CD IEC 61800-5-2) or *Stop Category 0* (as defined in EN 60204-1).

It is designed and approved suitable for the requirements of Safety Category 3 in EN 954-1. This functionality is called Safe Stop. Prior to integration and use of Safe Stop in an installation, a thorough risk analysis on the installation must be carried out in order to determine whether the Safe Stop functionality and safety category are appropriate and sufficient. In order to install and use the Safe Stop function in accordance with the requirements of Safety Category 3 in EN 954-1, the related information and instructions of the AF-650 GP Design Guide must be followed! The information and instructions of the Operating Instructions are not sufficient for a correct and safe use of the Safe Stop functionality!

2.1.8 Safe Stop Installation

To carry out an installation of a Category 0 Stop (EN60204) in conformity with Safety Category 3 (EN954-1), follow these instructions:

1. The bridge (jumper) between Terminal 37 and 24 V DC must be removed. Cutting or breaking the jumper is not sufficient. Remove it entirely to avoid short-circuiting. See jumper on illustration.
2. Connect terminal 37 to 24 V DC by a short-circuit protected cable. The 24 V DC voltage supply must be interruptible by an EN954-1 Category 3 circuit interrupt device. If the interrupt device and the frequency converter are placed in the same installation panel, you can use an unscreened cable instead of a screened one.

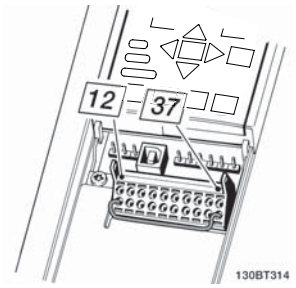

Illustration 2.1: Bridge jumper between terminal 37 and 24 VDC

The illustration below shows a Stopping Category 0 (EN 60204-1) with safety Category 3 (EN 954-1). The circuit interrupt is caused by an opening door contact. The illustration also shows how to connect a non-safety related hardware coast.

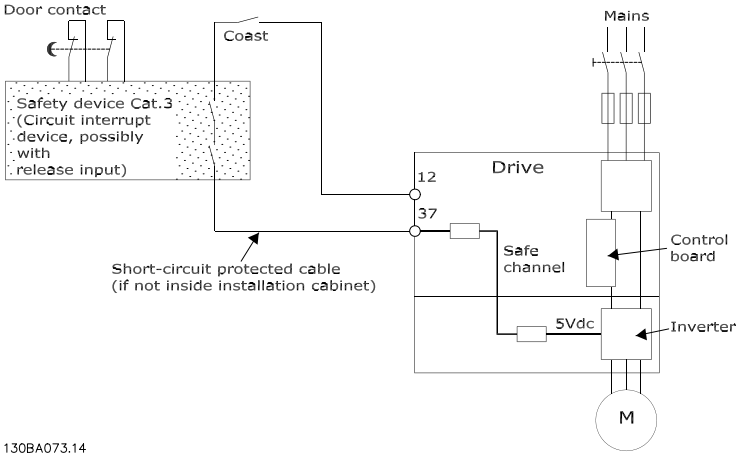

Illustration 2.2: Illustration of the essential aspects of an installation to achieve a Stopping Category 0 (EN 60204-1) with safety Category 3 (EN 954-1).

2.1.9 IT Mains

Par. SP-50 *RFI Filter* can be used to disable the factory installed A1/B1 RFI filter option. If this is done it will reduce the RFI performance to A2 level. For the 525 - 690 V frequency converters, par. SP-50 *RFI Filter* is not available as there is no A1/B1 Factory Installed RFI Filter option.

3 Installation

3.1 Pre-installation

3.1.1 Planning the Installation Site

NB!
Before performing the installation it is important to plan the installation of the frequency converter. Neglecting this may result in extra work during and after installation.

Select the best possible operation site by considering the following (see details on the following pages, and the respective Design Guides):

- Ambient operating temperature
- Installation method
- How to cool the unit
- Position of the frequency converter
- Cable routing
- Ensure the power source supplies the correct voltage and necessary current
- Ensure that the motor current rating is within the maximum current from the frequency converter
- Ensure that the drive is properly protected per local regulations.

3.1.2 Receiving the Frequency Converter

When receiving the frequency converter please make sure that the packaging is intact, and be aware of any damage that might have occurred to the unit during transport. In case damage has occurred, contact immediately the shipping company to claim the damage.

3.1.3 Transportation and Unpacking

Before unpacking the frequency converter it is recommended that it is located as close as possible to the final installation site.
Remove the box and handle the frequency converter on the pallet, as long as possible.

3.1.4 Lifting

Always lift the frequency converter in the dedicated lifting eyes. For all 4X unit size and 52 unit size (IP00) Units, use a bar to avoid bending the lifting holes of the frequency converter.

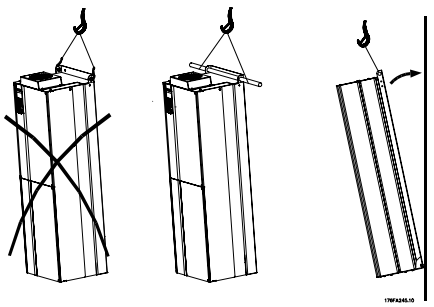

Illustration 3.1: Recommended lifting method, 4X and 5X Unit Sizes.

The lifting bar must be able to handle the weight of the frequency converter. See *Mechanical Dimensions* for the weight of the different Unit Sizes. Maximum diameter for bar is 2.5 cm (1 inch). The angle from the top of the drive to the lifting cable should be 60° C or greater.

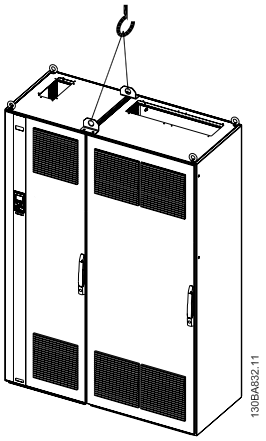

Illustration 3.2: Recommended lifting method, Unit Size 61 (460V, 600 to 900 HP, 575/600V, 900 to 1150 HP).

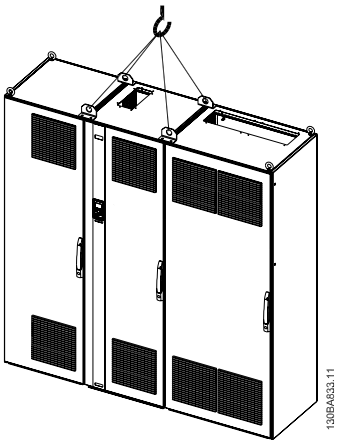

Illustration 3.4: Recommended lifting method, Unit Size 63 (460V, 600 to 900 HP, 575/600V, 900 to 1150 HP).

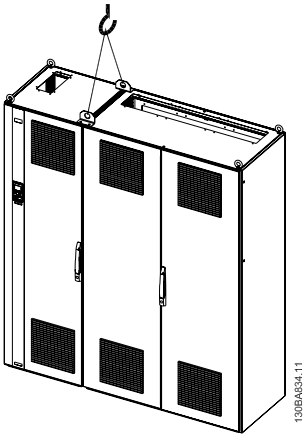

Illustration 3.3: Recommended lifting method, Unit Size 62 (460V, 1000 to 1200 HP, 575/600V, 1250 to 1350 HP).

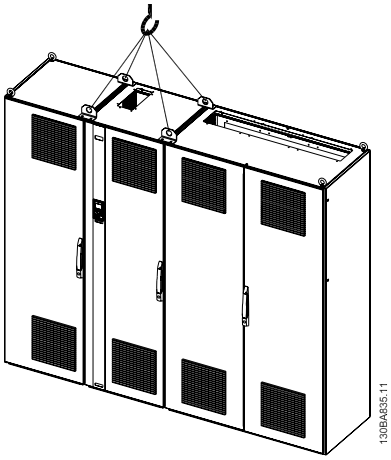

Illustration 3.5: Recommended lifting method, Unit Size 64 (460V, 1000 to 1200 HP, 575/600V, 1250 to 1350 HP).

NB!

Note the plinth is provided in the same packaging as the frequency converter but is not attached to Unit Sizes61-64 during shipment. The plinth is required to allow airflow to the drive to provide proper cooling. The unit sizes6X should be positioned on top of the plinth in the final installation location. The angle from the top of the drive to the lifting cable should be 60° C or greater.

In addition to the drawings above a spreader bar is an acceptable way to lift the unit sizes 6X.

3.2 Mechanical Installation

3.2.1 Tools Needed

To perform the mechanical installation the following tools are needed:

- Drill with 10 or 12 mm drill
- Tape measure
- Wrench with relevant metric sockets (7-17 mm)
- Extensions to wrench
- Sheet metal punch for conduits or cable glands in IP 21/Nema 1 and IP 54/Nema 12 drive types.
- Lifting bar to lift the unit (rod or tube max. Ø 25 mm (1 inch), able to lift minimum 400 kg (880 lbs)).
- Crane or other lifting aid to place the frequency converter in position
- A Torx T50 tool is needed to install the Unit Size 51IP 21/Nema 1 and IP 54/Nema 12 drive types.

3.2.2 Wall Mounting

This only applies to 41 and 42 Unit Sizes (460V, 125 - 300 HP, 575/600V, 125 - 400 HP).

Take the relevant points into consideration before you select the final installation site:

- Units may be wall mounted or free standing. A free-standing mounting kit is available from GE.
- Free space for cooling
- Access to open the door
- Cable entry from the bottom

3.2.3 Wall Mounting Instructions

1. Top and bottom clearance is required for cooling. A minimum of 225 mm (8.9 inch) below and above unit is required.
2. Mount unit vertically.
3. Mark mounting holes on wall carefully using mounting template from packaging and drill holes as indicated.
4. Fasten bottom bolts and lift unit up on bolts.
5. Tilt unit against wall and fasten upper bolts.
6. Tighten all four bolts to secure unit against the wall.

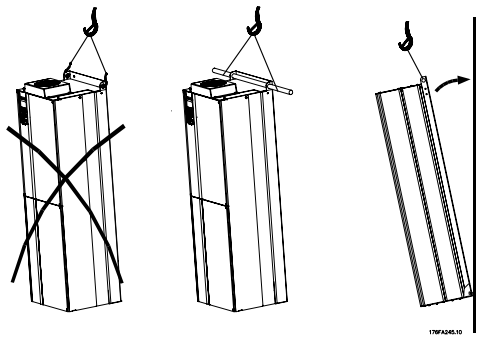

Illustration 3.6: Lifting method for wall mounting

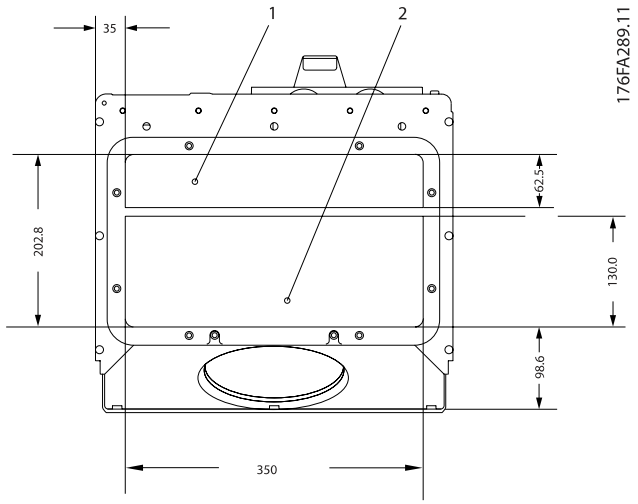
3.2.4 Floor Standing - IP21 (NEMA 1) and IP54 (NEMA12)

- Cables are connected through the gland plate from the bottom.
- Remove the plate and plan where to place the entry for the glands or conduits.
- Prepare holes in the marked area on the drawing.

NB!
The gland plate must be fitted to unit to ensure the specified protection and to ensure proper cooling. If the gland plate is not mounted, the unit on Alarm 69, Power Card Temperature

Unit Sizes 41 + 42



Unit Size 51

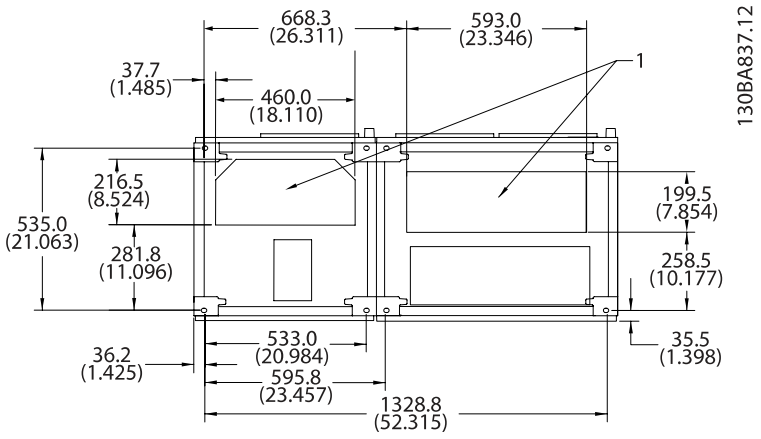
Unit Size 61



Unit Size 62

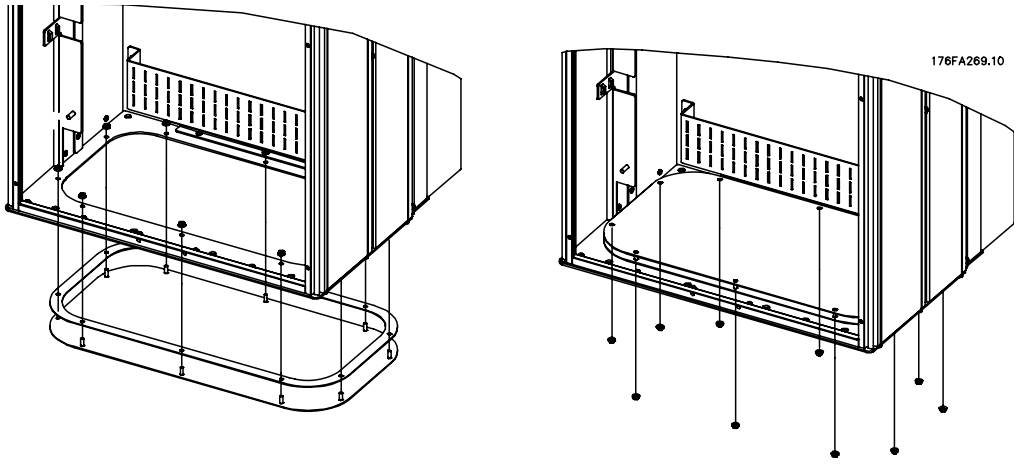


Illustration 3.7: Mounting of bottom plate,51Unit Size .

NB!

The bottom plate of the 51 Unit Size can be secured with attaching hardware from either inside or outside of the Unit Size for flexibility in the installation process.

3.2.5 IP21 Drip Shield Installation (Unit Sizes 41 and 42)

To comply with the IP21 rating, a separate drip shield is to be installed as explained below:

- Remove the two front screws
- Insert the drip shield and replace screws
- Torque the screws to 5,6 Nm (50 in-lbs)

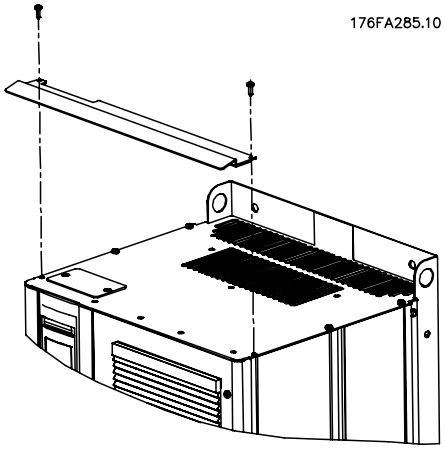

Illustration 3.8: Drip shield installation.

3.3 Field Installation of Options

3.3.1 Installation of Top-only Duct Cooling Kit

This description is for the installation of the top section only of the back-channel cooling kits available for unit sizes 43, 44 and 52. In addition to the enclosure a 200 mm vented pedestal is required.
The minimum enclosure depth is 500 mm (600 mm for unit size 52) and the minimum enclosure width is 600 mm (800 mm for unit size 52). The maximum depth and width are as required by the installation. When using multiple frequency converters in one enclosure mount each drive on its own back panel and support along the mid-section of the panel. The back-channel cooling kits are very similar in construction for all frames. The kits do not support "in frame" mounting of the frequency converters. The 52 kit is mounted "in frame" for additional support of the frequency converter.
Using these kits as described removes 85% of the losses via the back channel using the drive's main heat sink fan. The remaining 15% must be removed via the door of the enclosure.

Ordering information
Unit size 43 and 44: OPCDUCT4344T
Unit size 52: OPCDUCT52T

3.3.2 Installation of Top and Bottom Covers

Top and bottom covers can be installed on unit sizes 43, 44 and 52. These kits are designed to be used to direct the back-channel airflow in and out the back of the drive as opposed to in the bottom and out the top of the drive (when the drives are being mounted directly on a wall or inside a welded enclosure).

Notes:

1. If external duct work is added to the exhaust path of the drive, additional back pressure will be created that will reduce the cooling of the drive. The drive must be derated to accommodate the reduced cooling. First, the pressure drop must be calculated, then refer to the derating tables located earlier in this section.
2. A doorfan(s) is required on the enclosure to remove the heat losses not contained in the backchannel of the drive and any additional losses generated from other components installed inside the enclosure. The total required air flow must be calculated so that the appropriate fans can be selected. Some enclosure manufacturers offer software for performing the calculations (i.e. Rittal Therm software).
   If the frequency converter is the only heat generating component in the enclosure, the minimum airflow required at an ambient temperature of 45°C for the unit sizes 43, 44 and 52 drives is 391 m^3/h (230 cfm). The minimum airflow required at an ambient temperature of 45°C for the 52 unit size drive is 782 m^3/h (460 cfm).

Ordering information
Unit size 43 and 44: OPCDUCT4344TB
Unit size 52: OPCDUCT52TB

3.3.3 Outside Installation /NEMA 3R Kit of Industrial Enclosures

The kits are available for the unit sizes 43, 44 and 52. These kits are designed and tested to be used with IP00/Chassis drives in welded box construction enclosures with an environmental rating of NEMA-3R or NEMA-4. The NEMA-3R enclosure is a dust tight, rain tight, ice resistant, outdoor enclosure. The NEMA-4 enclosure is a dust tight and water tight enclosure.
This kit has been tested and complies with UL environmental rating Type-3R.
Note: The current rating of 43 and 44 unit size drives are de-rated by 3% when installed in a NEMA- 3R enclosure. 52 unit size drives require no de-rating when installed in a NEMA-3R enclosure.

Ordering information
Unit size 43: OPCDUCT433R
Unit size 44: OPCDUCT443R
Unit size 52: OPCDUCT523R

3.3.4 Installation of IP00 to IP20 Kits

The kits can be installed on unit sizes 43, 44, and 52 (IP00).

Ordering information
Unit size 43/44: Please consult GE
Unit size 52: Please consult GE

3.3.5 Installation of cable clamp bracket in open chassis drives.

The motor cable clamp brackets can be installed on open chassis drives in unit sizes 43, 44, and 52.

Ordering information
Unit size 43: Please consult GE
Unit size 44: Please consult GE
Unit size 52: Please consult GE

3.3.6 Installation on Pedestal

This section describes the installation of a pedestal unit available for the frequency converters Unit Sizes 41 and 42. This is a 200 mm high pedestal that allows these Units to be floor mounted. The front of the pedestal has openings for input air to the power components.

The frequency converter gland plate must be installed to provide adequate cooling air to the control components of the frequency converter via the door fan and to maintain the IP21/NEMA 1 or IP54/NEMA 12 degrees of Unit protections.

Illustration 3.9: Drive on pedestal

There is one pedestal that fits both Unit Sizes 41 and 42. The pedestal is standard for Unit Size 51.

Ordering information
Unit size 41/42: OPC4XPED

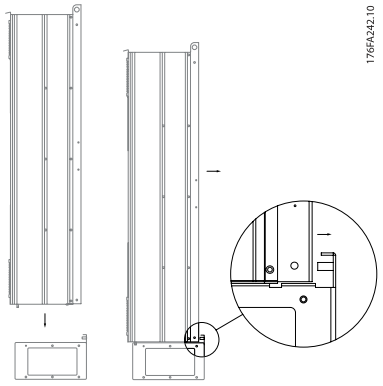

Illustration 3.10: Mounting of drive to pedestal.

3.3.7 Installation of Mains Shield for Frequency Converters

This section is for the installation of a mains shield for the frequency converter series with Unit Sizes 41, 42 and 51. It is not possible to install in the IP00/ Chassis drive types as these have included as standard a metal cover. These shields satisfy VBG-4 requirements.

NB!
For further information, please consult GE.

3.3.8 Unit Size 6x USB Extension Kit

A USB extension cable can be installed into the door of unit size 6x frequency converters.

NB!
For further information, please consult GE.

3.3.9 Installation of 4x or 5x Loadshare Option

The loadshare option can be installed on unit sizes 41, 42, 43, 44, 51 and 52.

Ordering information
Unit size 41/43: OPCLSK41
Unit size 42/44: OPCLSK42
Unit size 51/52: OPCLSK51 for 460 VAC
OPCLSK52 for 575 VAC

3.4 Electrical Installation

3.4.1 Power Connections

Cabling and Fusing

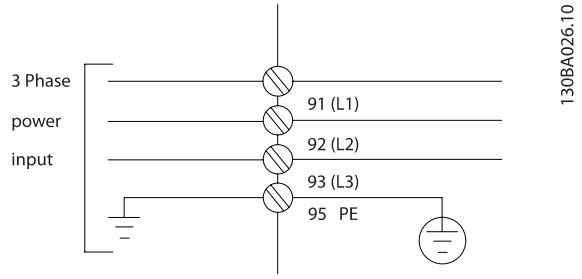
NB!

Cables General

All cabling must comply with national and local regulations on cable cross-sections and ambient temperature. Copper (75°C) conductors are recommended.

The power cable connections are situated as shown below. Dimensioning of cable cross section must be done in accordance with the current ratings and local legislation. See the *Specifications section* for details.

For protection please see fuse in the tables of the fuse section. Always ensure that proper fusing is made according to local regulation.



NB!

Use a screened/armoured motor cable to comply with EMC emission specifications. For more information, see *EMC specifications* in the *Design Guide*.

See section *General Specifications* for correct dimensioning of motor cable cross-section and length.

Screening of cables:

Avoid installation with twisted screen ends (pigtails). They spoil the screening effect at higher frequencies. If it is necessary to break the screen to install a motor isolator or motor contactor, the screen must be continued at the lowest possible HF impedance.

Connect the motor cable screen to both the de-coupling plate of the frequency converter and to the metal housing of the motor.

Make the screen connections with the largest possible surface area (cable clamp). This is done by using the supplied installation devices within the frequency converter.

Cable-length and cross-section:

The frequency converter has been EMC tested with a given length of cable. Keep the motor cable as short as possible to reduce the noise level and leakage currents.

3.4.2 Earthing

The following basic issues need to be considered when installing a frequency converter, so as to obtain electromagnetic compatibility (EMC).

- Safety earthing: Please note that the frequency converter has a high leakage current and must be earthed appropriately for safety reasons. Apply local safety regulations.
- High-frequency earthing: Keep the earth wire connections as short as possible.

Connect the different earth systems at the lowest possible conductor impedance. The lowest possible conductor impedance is obtained by keeping the conductor as short as possible and by using the greatest possible surface area.
The metal cabinets of the different devices are mounted on the cabinet rear plate using the lowest possible HF impedance. This avoids having different HF voltages for the individual devices and avoids the risk of radio interference currents running in connection cables that may be used between the devices. The radio interference will have been reduced.
In order to obtain a low HF impedance, use the fastening bolts of the devices as HF connection to the rear plate. It is necessary to remove insulating paint or similar from the fastening points.

3.4.3 Extra Protection (RCD)

ELCB relays, multiple protective earthing or earthing can be used as extra protection, provided that local safety regulations are complied with.

In the case of an earth fault, a DC component may develop in the fault current.

If ELCB relays are used, local regulations must be observed. Relays must be suitable for protection of 3-phase equipment with a bridge rectifier and for a brief discharge on power-up.

See also the section *Special Conditions* in the Design Guide.

3.4.4 Drives with Factory installed A1/B1 RFI Filter Option:

Mains supply isolated from earth

If the frequency converter is supplied from an isolated mains source (IT mains, floating delta and grounded delta) or TT/TN-S mains with grounded leg, the RFI switch is recommended to be turned off (OFF) via par. SP-50 *RFI Filter* on the drive and par. SP-50 *RFI Filter* on the filter. For further reference, see IEC 364-3. In case optimum EMC performance is needed, parallel motors are connected or the motor cable length is above 25 m, it is recommended to set par. SP-50 *RFI Filter* to [ON].
In OFF, the internal RFI capacities (filter capacitors) between the chassis and the intermediate circuit are cut off to avoid damage to the intermediate circuit and to reduce the earth capacity currents (according to IEC 61800-3).
It is important to use isolation monitors that are capable for use together with power electronics (IEC 61557-8).

3.4.5 Torque

When tightening all electrical connections it is very important to tighten with the correct torque. Too low or too high torque results in a bad electrical connection. Use a torque wrench to ensure correct torque

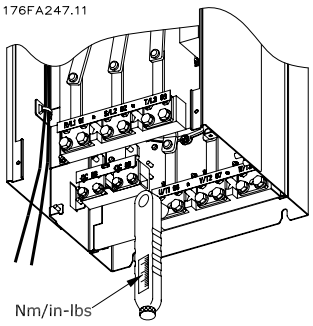

Illustration 3.20: Always use a torque wrench to tighten the bolts.

Unit Size	Terminal	Torque	Bolt size
41, 42, 43 and 44	Mains Motor	19-40 Nm (168-354 in-lbs)	M10
	Load sharing Brake	8.5-20.5 Nm (75-181 in-lbs)	M8
51 and 52	Mains Motor Load sharing	19-40 Nm (168-354 in-lbs)	M10
	Brake	8.5-20.5 Nm (75-181 in-lbs)	M8
61, 62, 63 and 64	Mains Motor	19-40 Nm (168-354 in-lbs)	M10
	Load sharing	19-40 Nm (168-354 in-lbs)	M10
	Brake	8.5-20.5 Nm (75-181 in-lbs)	M8
	Regen	8.5-20.5 Nm (75-181 in-lbs)	M8

Table 3.1: Torque for terminals

3.4.6 Shielded Cables

It is important that shielded and armoured cables are connected in a proper way to ensure high EMC immunity and low emissions.

Connection can be made using either cable glands or clamps:

- EMC cable glands: Generally available cable glands can be used to ensure an optimum EMC connection.
- EMC cable clamp: Clamps allowing easy connection are supplied with the frequency converter.

3.4.7 Shielding against Electrical Noise

Before mounting the mains power cable, mount the EMC metal cover to ensure best EMC performance.

NOTE: The EMC metal cover is only included in units with factory installed A1/B1 RFI Filter option..

Illustration 3.21: Mounting of EMC shield.

3.4.8 Mains Connection

Mains must be connected to terminals 91, 92 and 93. Earth is connected to the terminal to the right of terminal 93.

Terminal No.	Function
91, 92, 93	Mains R/L1, S/L2, T/L3
94	Earth

NB!
Check the name plate to ensure that the mains voltage of the frequency converter matches the power supply of your plant.

Ensure that the power supply can supply the necessary current to the frequency converter.

3.4.9 External Fan Supply

Unit size 4x, 5x and 6x
In case the frequency converter is supplied by DC or if the fan must run independently of the power supply, an external power supply can be applied. The connection is made on the power card.

Terminal No.	Function
100, 101	Auxiliary supply S, T
102, 103	Internal supply S, T

The connector located on the power card provides the connection of line voltage for the cooling fans. The fans are connected from factory to be supplied form a common AC line (jumpers between 100-102 and 101-103). If external supply is needed, the jumpers are removed and the supply is connected to terminals 100 and 101. A 5 Amp fuse should be used for protection. In UL applications this should be LittleFuse KLK-5 or equivalent.

3.4.10 Fuses

Branch circuit protection:

In order to protect the installation against electrical and fire hazard, all branch circuits in an installation, switch gear, machines etc., must be short-circuited and over-current protected according to national/international regulations.

Short-circuit protection:

The frequency converter must be protected against short-circuit to avoid electrical or fire hazard. GE recommends using the fuses mentioned below to protect service personnel and equipment in case of an internal failure in the drive. The frequency converter provides full short-circuit protection in case of a short-circuit on the motor output.

Over-current protection

Provide overload protection to avoid fire hazard due to overheating of the cables in the installation. Fuses or circuit breakers can be used to provide the over-current protection in the installation. Over-current protection must always be carried out according to national regulations.

380-480 V, frame sizes 4X, 5X and 6X

The fuses below are suitable for use on a circuit capable of delivering 100,000 Arms (symmetrical), 240V, or 480V, or 600V depending on the drive voltage rating. With the proper fusing the drive Short Circuit Current Rating (SCCR) is 100,000 Arms.

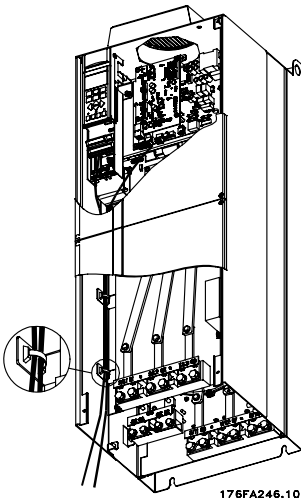
3.4.11 Control Cable Routing

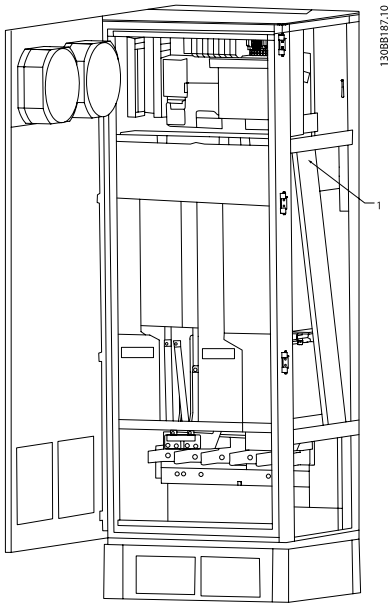
Tie down all control wires to the designated control cable routing as shown in the picture. Remember to connect the shields in a proper way to ensure optimum electrical immunity.

Field Installed Network Module options connection

Connections are made to the network options on the control card. For details see the relevant network instructions. The cable must be placed in the provided path inside the frequency converter and tied down together with other control wires (see pictures).



Control card wiring path for the 43. Control card wiring for the 41, 42, 44, 51 and 52 use the same path.



Control card wiring path for the 61/63. Control card wiring for the 62/64 use the same path.

In the Chassis (IP00) and NEMA 1 units it is also possible to connect the network from the top of the unit as shown in the following pictures. On the NEMA 1 unit a cover plate must be removed.

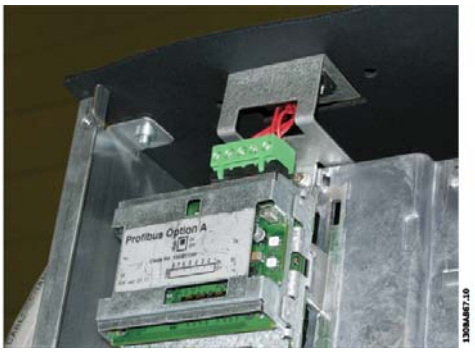


Illustration 3.22: Top connection for network.

Installation of field installed 24 Volt external DC Supply option module (OPC24VPS)

Torque: 0.5 - 0.6 Nm (5 in-lbs)

Screw size: M3

No.	Function
35 (-), 36 (+)	24 V external DC supply

24 VDC external supply can be used as low-voltage supply to the control card and any I/O or network option cards installed. This enables full operation of the Keypad (including parameter setting) without connection to mains. Please note that a warning of low voltage will be given when 24 VDC has been connected; however, there will be no tripping.

Use 24 VDC supply of type PELV to ensure correct galvanic isolation (type PELV) on the control terminals of the frequency converter.

3.4.12 Access to Control Terminals

All terminals to the control cables are located beneath the Keypad. They are accessed by opening the door of the Nema 1 / Nema 12 or removing the covers of the IP00 Open Chassis version.

3.4.13 Electrical Installation, Control Terminals

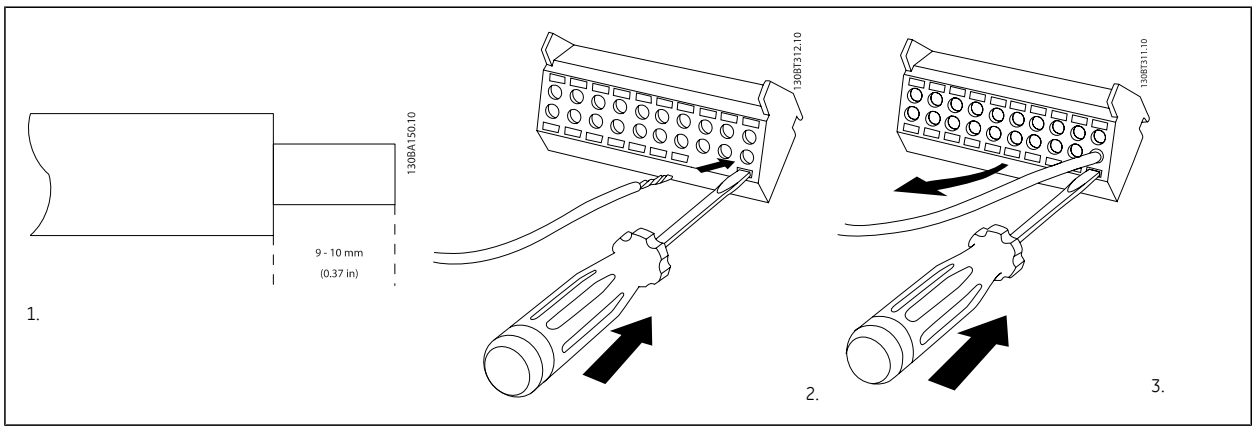
To connect the cable to the terminal:

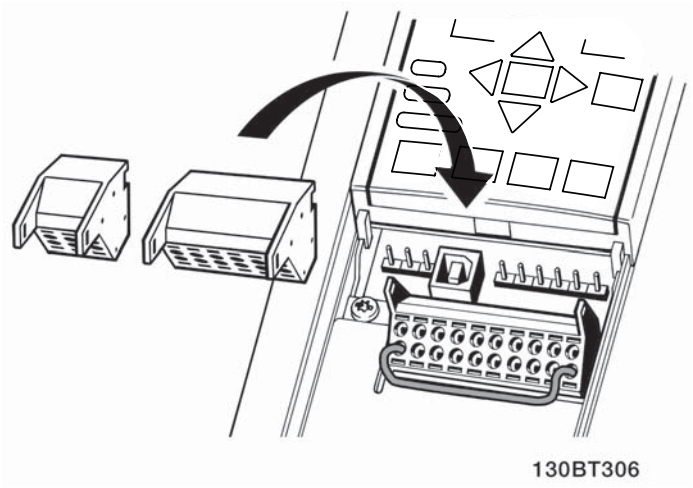
1. Strip insulation by about 9-10 mm
2. Insert a screwdriver[1)] in the square hole.
3. Insert the cable in the adjacent circular hole.
4. Remove the screwdriver. The cable is now mounted in the terminal.

To remove the cable from the terminal:

1. Insert a screw driver[1)] in the square hole.
2. Pull out the cable.

[1)] Max. 0.4 x 2.5 mm

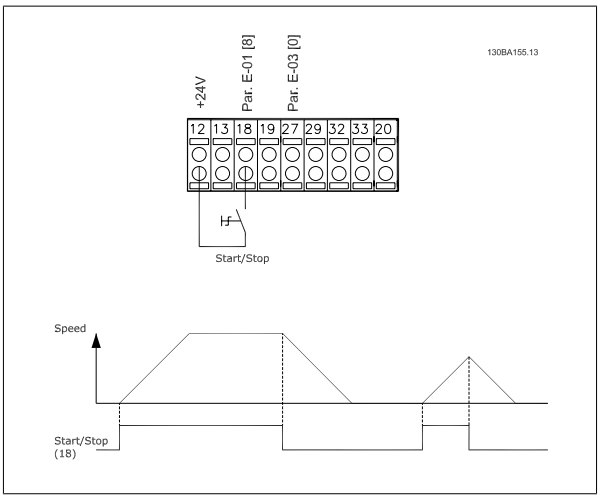




3.5 Connection Examples

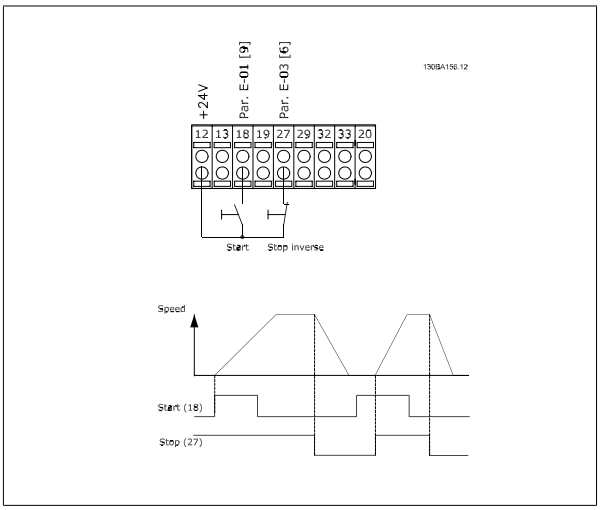
3.5.1 Start/Stop

Terminal 18 = par. E-01 *Terminal 18 Digital Input* [8] *Start*
Terminal 27 = par. E-03 *Terminal 27 Digital Input* [0] *No operation* (Default *coast inverse*)



3.5.2 Pulse Start/Stop

Terminal 18 = par. E-01 *Terminal 18 Digital Input* [9] *Latched start*
Terminal 27= par. E-03 *Terminal 27 Digital Input* [6] *Stop inverse*



3.5.3 Speed Up/Down

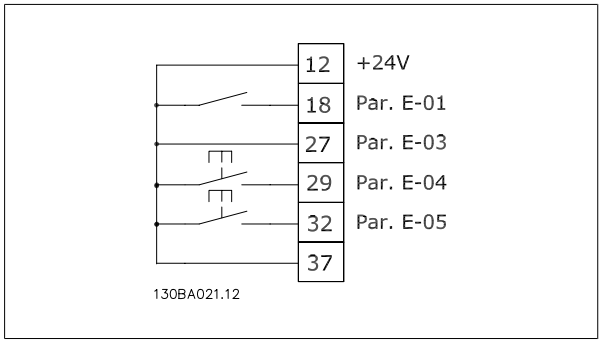
Terminals 29/32 = Speed up/down:

Terminal 18 = par. E-01 *Terminal 18 Digital Input* Start [9] (default)

Terminal 27 = par. E-03 *Terminal 27 Digital Input* Freeze reference [19]

Terminal 29 = par. E-04 *Terminal 29 Digital Input* Speed up [21]

Terminal 32 = par. E-05 *Terminal 32 Digital Input* Speed down [22]



3.5.4 Potentiometer Reference

Voltage reference via a potentiometer:

Reference Source 1 = [1] *Analog input 53* (default)

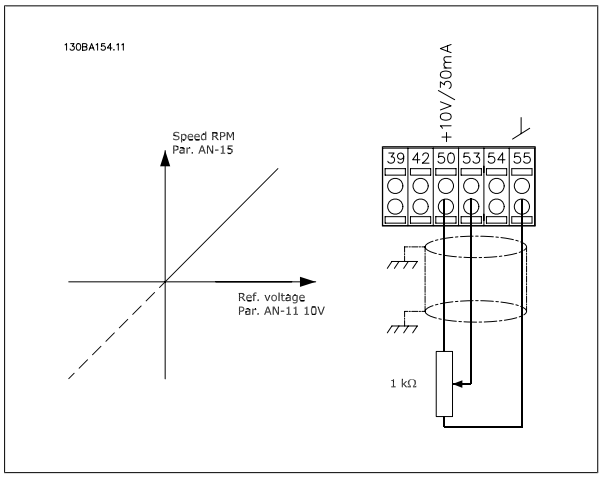
Terminal 53, Low Voltage = 0 Volt

Terminal 53, High Voltage = 10 Volt

Terminal 53, Low Ref./Feedback = 0 RPM

Terminal 53, High Ref./Feedback = 1500 RPM

Switch S201 = OFF (U)



3.5.5 External Hand Off Auto Example

Hand Off Auto (HOA), without the use of the Drive keypad

To have a HOA system with an external 0-10V potentiometer for the hand reference and a 4-20mA signal for the auto reference, 2 set-ups should be used. In this example we use set-up 1 for the hand mode and set-up 2 for the auto mode. We use analog input 53 for the hand reference (0-10V potentiometer) and analog input 54 for the auto reference (4-20mA) and digital input 27 for the set-up selector. Please ensure that the analog inputs have the correct dip settings (A-53 [U] and A-54 [I]).

In the upper right corner of the keypad you can see 2 numbers – like 1(1). The number outside the parenthesis is the active set-up and the number inside the parenthesis is the set-up which will be edited. Default will always be 1(1). Make sure you edit set-up 1.

1. Make all the parameter changes you need, that will be common for auto and hand mode, like motor parameters etc.
2. Set par. K-10 *Active set-up* to [9] Multi Set-up. This parameter change is needed to be able to change set-up from an external source, like a digital input.
3. Set par. K-11 *Edit Set-up* to [9] Active Set-up. This is recommended because then the active setup will always be the set-up that is edited. If you prefer you can also ignore this and manually control what set-up you want to edit through par. K-11.
4. Set par. E-03 *Terminal 27 Digital Input* to [23] Set-up select bit 0. When terminal 27 is OFF, set-up 1 (hand) is active, when it is ON, set-up 2 (auto) is active.
5. Set par. F-01 *Frequency Setting 1* to Analog input 53 (hand mode).
6. Ensure par. C-30 *Frequency Command 2* and par. C-34 *Frequency Command 3*are both No Function. This is good practice to make sure no other references are added.
7. Copy set-up 1 to set-up 2. Set par. K-51 *Set up Copy* to [2] Copy to set-up 2. Now setup 1 and 2 are identical.
8. If you need to be able to change between hand and auto mode while the motor is running you will have to link the 2 set-ups together. Set par. K-12 *This Set-up Linked to* to [2] set-up 2.
9. Change to set-up 2 by setting input 27 ON (if par. K-11 is [9]) or by setting par. K-11 *Edit Set-up* to set-up 2.
10. Set par. F-01 *Frequency Setting 1* to Analog input 54 (auto mode).

If you want different settings in hand and auto mode, like different accel/decel ramps, speed limits etc. you can now programme them. You just have to make sure you edit the correct set-up. Set-up 1 is Hand mode and set-up 2 is Auto mode.

External Hand-Off-Auto Selector Switch Wiring

Illustration 3.23: GE 30mm HOA Cat# (1) 104PSG34B & (3) CR104PXC1

3

3.6 Electrical Installation, continued...

3.6.1 Electrical Installation, Control Cables

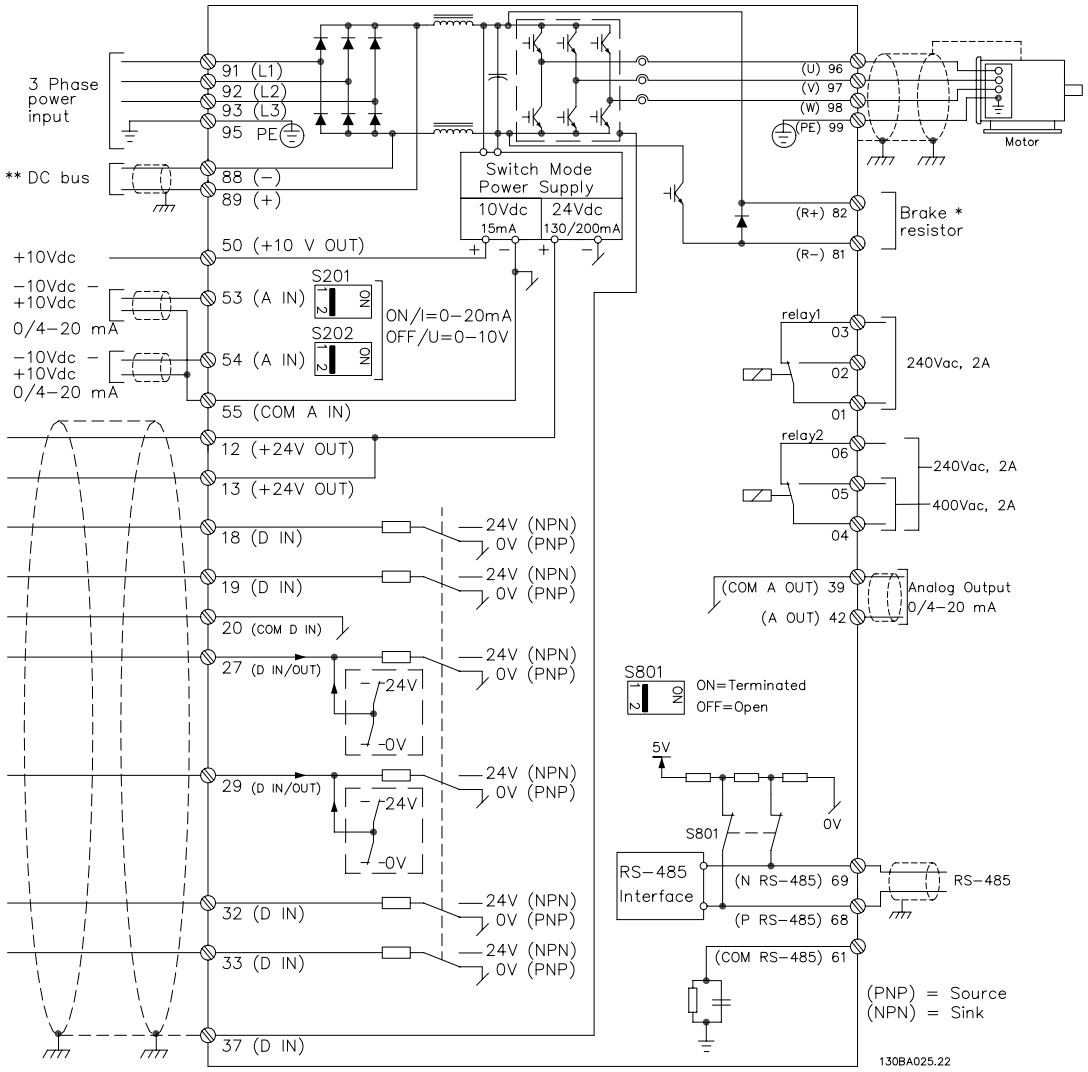


Illustration 3.24: Diagram showing all electrical terminals without options.

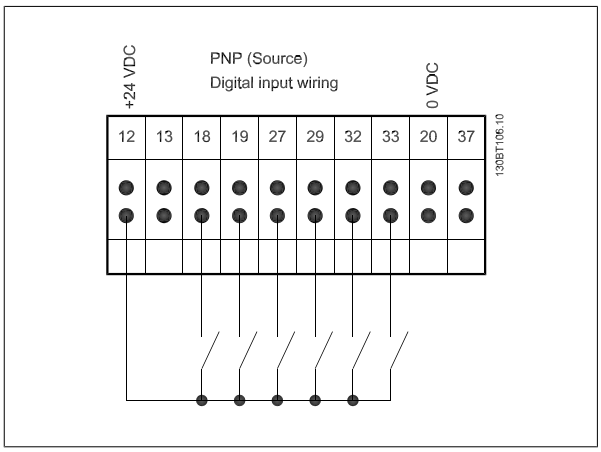
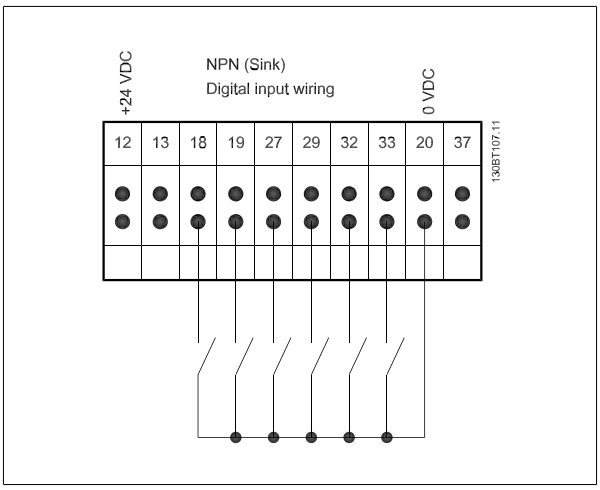
Very long control cables and analogue signals may in rare cases and depending on installation result in 50/60 Hz earth loops due to noise from mains supply cables.

If this occurs, it may be necessary to break the screen or insert a 100 nF capacitor between screen and chassis.

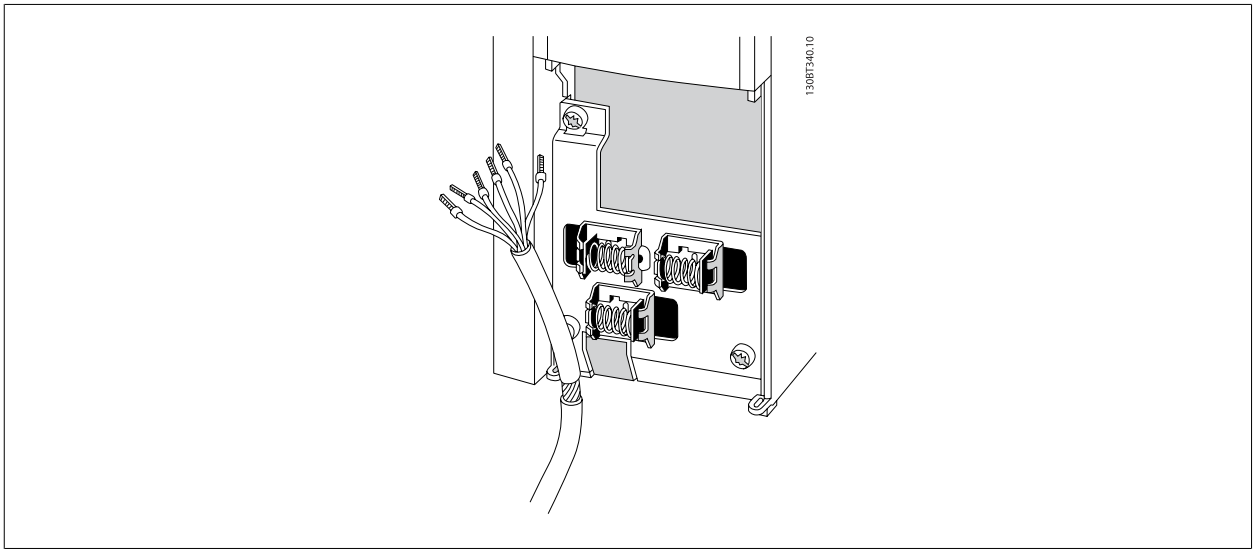
The digital and analog inputs and outputs must be connected separately to the frequency converter common inputs (terminal 20, 55, 39) to avoid earth currents from both groups to affect other groups. For example, switching on the digital input may disturb the analog input signal.

Input polarity of control terminals





NB!
Control cables must be screened/armoured.



Connect the wires as described in the Operating Instruction for the frequency converter. Remember to connect the shields in a proper way to ensure optimum electrical immunity.

3.6.2 Switches S201, S202, and S801

Switches S201 (A53) and S202 (A54) are used to select a current (0-20 mA) or a voltage (-10 to 10 V) configuration of the analog input terminals 53 and 54 respectively.

Switch S801 (BUS TER.) can be used to enable termination on the RS-485 port (terminals 68 and 69).

See drawing *Diagram showing all electrical terminals* in section *Electrical Installation.*

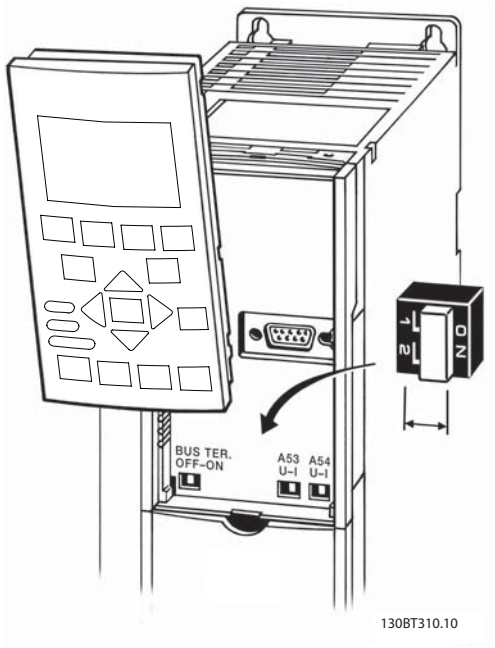
Default setting:

S201 (A53) = OFF (voltage input)

S202 (A54) = OFF (voltage input)

S801 (Bus termination) = OFF

NB!
When changing the function of S201, S202 or S801 be careful not to use force for the switch over. It is recommended to remove the Keypad fixture (cradle) when operating the switches. The switches must not be operated with power on the frequency converter.



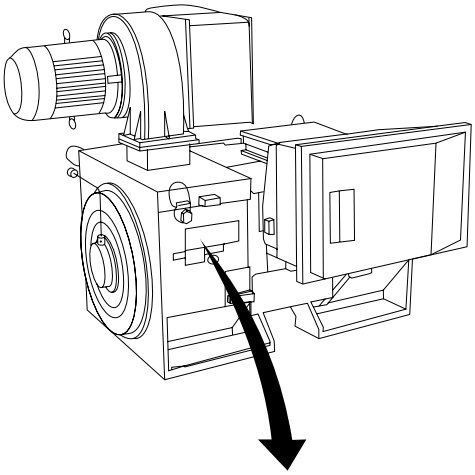
3.7 Final Set-Up and Test

To test the set-up and ensure that the frequency converter is running, follow these steps.

Step 1. Locate the motor name plate

NB!

The motor is either star- (Y) or delta- connected (Δ). This information is located on the motor name plate data.



THREE PHASE INDUCTION MOTOR							
MOD MCV 315E	Nr. 135189 12 04					IL/IN 6.5	
kW 400	PRIMARY					SF 1.15	
HP 536	V 690	A 410.6	CONN Y			COS f 0.85	40
mm 1481	V	A	CONN			AMB 40	°C
Hz 50	V	A	CONN			ALT 1000	m
DESIGNN	SECONDARY					RISE 80	°C
DUTY S1	V	A	CONN			ENCLOSURE IP23	
INSUL I	EFFICIENCY %	95.8%	100%	95.8%	75%	WEIGHT 1.83 ton	
⚠ CAUTION							

Step 2. Enter the motor name plate data in this parameter list.

To access this list first press the [QUICK MENU] key then select "Quick Setup". Use the up and down arrow keys to navigate to the parameters associated with the motor nameplate values.

1.	Par. P-07 *Motor Power [kW]* Par. P-02 *Motor Power [HP]*
2.	Par. F-05 *Motor Rated Voltage*
3.	Par. F-04 *Base Frequency*
4.	Par. P-03 *Motor Current*
5.	Par. P-06 *Base Speed*

Step 3. Activate the Auto tune

Performing an auto tune will ensure optimum performance. The auto tune measures the values from the motor model equivalent diagram.

1. Activate the auto tune par. P-04 *Auto Tune.*
2. Choose between complete or reduced auto tune. If a Sine-wave filter is mounted, run only the reduced auto tune, or remove the Sine-wave filter and run complete Auto Tune.
3. Press the [OK] key. The display shows "Press [Hand] to start".
4. Press the [Hand] key. A progress bar indicates if the auto tune is in progress.

Stop the auto tune during operation

1. Press the [OFF] key - the frequency converter enters into alarm mode and the display shows that the auto tune was terminated by the user.

Successful auto tune

1. The display shows "Press [OK] to finish auto tune".
2. Press the [OK] key to exit the auto tune state.

Unsuccessful auto tune

1. The frequency converter enters into alarm mode. A description of the alarm can be found in the *Warnings and Alarms* chapter.
2. "Report Value" in the [Alarm Log] shows the last measuring sequence carried out by the auto tune, before the frequency converter entered alarm mode. This number along with the description of the alarm will assist you in troubleshooting. If you contact GE for service, make sure to mention number and alarm description.

NB!
Unsuccessful auto tune is often caused by incorrectly entering motor name plate data or a too big difference between the motor power size and the frequency converter power size.

Step 4. Set speed limit and accel/decel times.

Par. F-52 *Minimum Reference*
Par. F-53 *Maximum Reference*

Table 3.10: Set up the desired limits for speed and ramp time.

Par. F-18 *Motor Speed Low Limit [RPM]* or par. F-16 *Motor Speed Low Limit [Hz]*
Par. F-17 *Motor Speed High Limit [RPM]* or par. F-15 *Motor Speed High Limit [Hz]*

Par. F-07 *Accel Time 1*
Par. F-08 *Decel Time 1*

4 How to Program

4.1 The Graphical

The easiest programming of the frequency converter is performed by the Graphical Keypad.

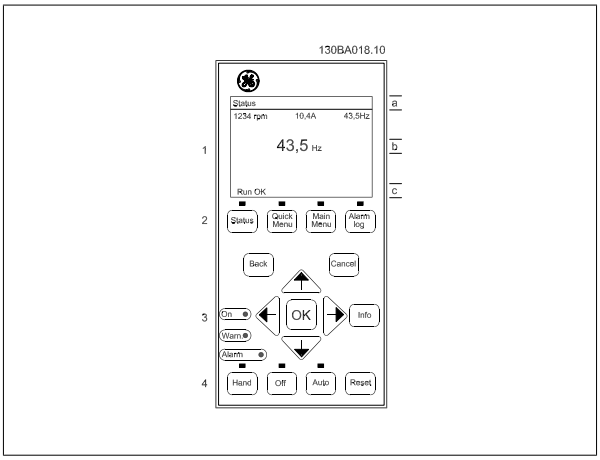
4.1.1 How to Program on the Graphical Keypad

The following instructions are valid for the graphical Keypad:

The keypad is divided into four functional groups:

1. Graphical display with Status lines.
2. Menu keys and indicator lights - changing parameters and switching between display functions.
3. Navigation keys and indicator lights (LEDs).
4. Operation keys and indicator lights (LEDs).

All data is displayed in the display, which can show up to five items of operating data while displaying [Status].



Display lines:

a. **Status line:** Status messages displaying icons and graphic.

b. **Line 1-2:** Operator data lines displaying data defined or chosen by the user. By pressing the [Status] key, up to one extra line can be added.

c. **Status line:** Status messages displaying text.

4.1.2 Initial Commissioning

The easiest way of carrying out the initial commissioning is by using the Quick Menu button and follow the quick set-up procedure using Keypad (read table from left to right). The example applies to open loop applications:

Press				
Quick Menu	▲	Quick Start	OK	▲
Par. K-01 *Language*	OK	Set language	▲	
Par. K-02 *Motor Speed Unit*	OK	Set motor speed in Hz or RPM	▲	
Par. P-02 *Motor Power [HP]* or Par. P-07 *Motor Power [kW]*	OK	Set Motor nameplate power	▲	
Par. F-05 *Motor Rated Voltage*	OK	Set Nameplate voltage	▲	
Par. F-04 *Base Frequency*	OK	Set Nameplate frequency	▲	
Par. P-03 *Motor Current*	OK	Set Nameplate current	▲	
Par. P-06 *Base Speed*	OK	Set Nameplate speed in RPM	▲	
Par. F-01 *Frequency Setting 1*	OK	Set reference source	▲	
Par. F-02 *Operation Method*	OK	Select which reference site to activate	▲	
Par. F-07 *Accel Time 1*	OK	Set the accel time with reference to synchronous motor speed, n_s	▲	
Par. F-08 *Decel Time 1*	OK	Set the decel time time with reference to synchronous motor speed, n_s	▲	
Par. F-10 *Electronic Overload*	OK	Set motor thermal protection	▲	
Par. F-15 *Motor Speed High Limit [Hz]* or Par. F-17 *Motor Speed High Limit [RPM]*	OK	Set motor speed high limit in Hz or RPM	▲	
Par. F-16 *Motor Speed Low Limit [Hz]* or Par. F-18 *Motor Speed Low Limit [RPM]*	OK	Set motor speed low limit in Hz or RPM	▲	
Par. H-08 *Reverse Lock*	OK	Set allowed rotation direction	▲	
Par. P-04 *Auto Tune*	OK	Set desired auto tune function. Enable complete auto tune is recommended	▲	

4.2 Quick Setup Parameter List

K-01 Language

Option:		Function:
		Defines the language to be used in the display. The frequency converter is delivered with 4 different languages.
[0] *	English	
[2]	Francais	
[4]	Spanish	
	Chinese	
	English UK	

K-02 Motor Speed Unit

Option:		Function:
		This parameter cannot be adjusted while the motor is running. The display showing depends on settings in par. K-02 *Motor Speed Unit* and par. K-03 *Regional Settings*. The default setting of par. K-02 *Motor Speed Unit* and par. K-03 *Regional Settings* depends on which region of the world the frequency converter is supplied to, but can be re-programmed as required. **NB!** Changing the *Motor Speed Unit* will reset certain parameters to their initial value. It is recommended to select the motor speed unit first, before modifying other parameters.
[0]	RPM	Selects display of motor speed variables and parameters (i.e. references, feedbacks and limits) in terms of motor speed (RPM).
[1] *	Hz	Selects display of motor speed variables and parameters (i.e. references, feedbacks and limits) in terms of output frequency to the motor (Hz).

P-02 Motor Power [HP]

Range:		Function:
4.00 hp*	[0.09 - 3000.00 hp]	

P-07 Motor Power [kW]

Range:		Function:
4.00 kW*	[0.09 - 3000.00 kW]	

F-05 Motor Rated Voltage

Range:		Function:
400. V*	[10. - 1000. V]	

F-04 Base Frequency

Range:		Function:
50. Hz*	[20 - 1000 Hz]	Min - Max motor frequency: 20 - 1000 Hz. Select the motor frequency value from the motor nameplate data. If a value different from 50 Hz or 60 Hz is selected, it is necessary to adapt the load independent settings in par. H-50 *Motor Magnetisation at Zero Speed* to par. H-53 *Model Shift Frequency*. For 87 Hz operation with 230/400 V motors, set the nameplate data for 230 V/50 Hz. Adapt par. F-17 *Motor Speed High Limit [RPM]* and par. F-53 *Maximum Reference* to the 87 Hz application.

P-03 Motor Current

Range:		Function:
7.20 A*	[0.10 - 10000.00 A]	

NB!
This parameter cannot be adjusted while the motor is running.

P-06 Base Speed

Range:		Function:
1420. RPM*	[100 - 60000 RPM]	Enter the nominal motor speed value from the motor nameplate data. This data is used for calculating automatic motor compensations.

NB!
This parameter cannot be adjusted while the motor is running.

F-01 Frequency Setting 1

Option:		Function:
		Select the reference input to be used for the first reference signal. par. F-01 *Frequency Setting 1*, par. C-30 *Frequency Command 2* and par. C-34 *Frequency Command 3* define up to three different reference signals. The sum of these reference signals defines the actual reference.
[0]	No function	
[1] *	Analog Input 53	
[2]	Analog Input 54	
[7]	Frequency input 29	
[8]	Frequency input 33	
[11]	Local bus reference	
[20]	Digital Potentiometer	
[21]	Analog input X30-11	(General Purpose I/O Option Module)
[22]	Analog input X30-12	(General Purpose I/O Option Module)

F-02 Operation Method

Option:		Function:
		Select which reference site to activate.
[0] *	Linked to Hand / Auto	Use local reference when in Hand mode; or remote reference when in Auto mode.
[1]	Remote	Use remote reference in both Hand mode and Auto mode.
[2]	Local	Use local reference in both Hand mode and Auto mode.
		NB! When set to Local [2], the frequency converter will start with this setting again following a 'power down'.

F-07 Accel Time 1

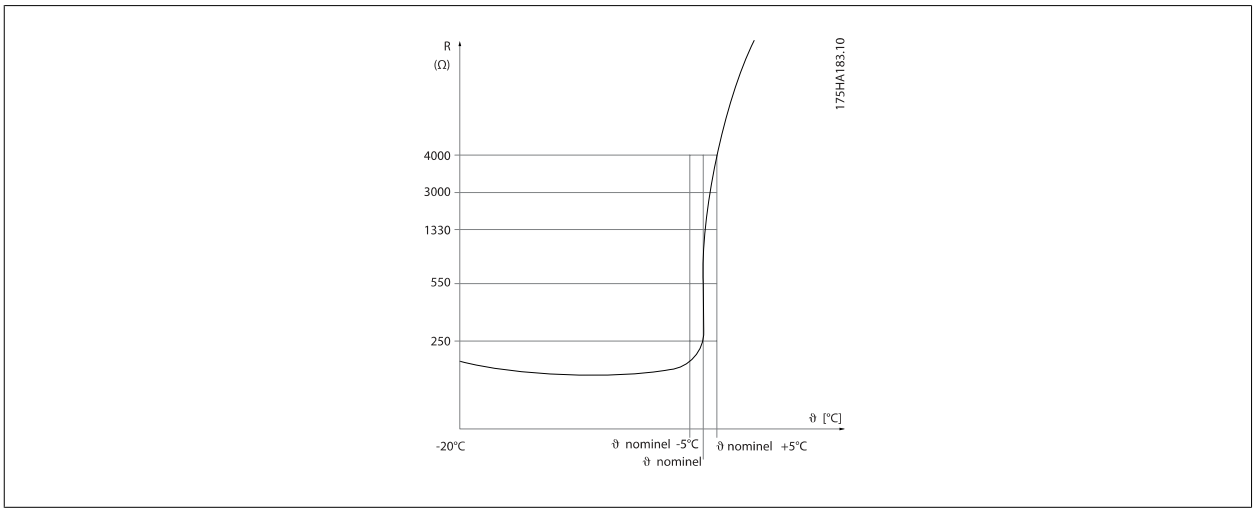
Range:		Function:
3.00 s*	[0.01 - 3600.00 s]	

F-08 Decel Time 1

Range:		Function:
3.00 s*	[0.01 - 3600.00 s]	

F-10 Electronic Overload

Option:		Function:
		The frequency converter determines the motor temperature for motor protection in two different ways: • Via a thermistor sensor connected to one of the analog or digital inputs (par. F-12 *Motor Thermistor Input*). • Via calculation of the thermal load, based on the actual load and time. The calculated thermal load is compared with the rated motor current $I_{M,N}$ and the rated motor frequency $f_{M,N}$. The calculations estimate the need for a lower load at lower speed due to less cooling from the fan incorporated in the motor.
[0] *	No protection	Continuously overloaded motor, when no warning or trip of the frequency converter is required.
[1]	Thermistor warning	Activates a warning when the connected thermistor or KTY-sensor in the motor reacts in the event of motor over-temperature.
[2]	Thermistor trip	Stops (trips) frequency converter when connected thermistor in motor reacts in the event of motor over-temperature. The thermistor cut-out value must be > 3 kΩ. Integrate a thermistor (PTC sensor) in the motor for winding protection.
[3]	Elec. OL Warning 1	Please see detailed description below
[4]	Elec. OL Trip 1	
[5]	Elec. OL Warning 2	
[6]	Elec. OL Trip 2	
[7]	Elec. OL Warning 3	
[8]	Elec. OL Trip 3	
[9]	Elec. OL Warning 4	
[10]	Elec. OL Trip 4	



Motor protection can be implemented using a range of techniques: PTC or KTY sensor (see also section *KTY Sensor Connection*) in motor windings; mechanical thermal switch (Klixon type); or Electronic Thermal Overload.

4

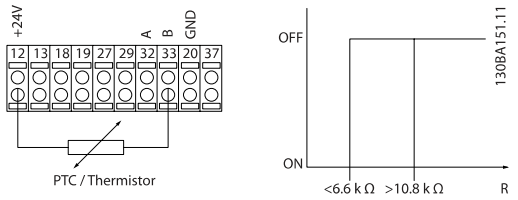
Using a digital input and 24 V as power supply:

Example: The frequency converter trips when the motor temperature is too high

Parameter set-up:

Set par. F-10 *Electronic Overload* to *Thermistor Trip* [2]

Set par. F-12 *Motor Thermistor Input* to *Digital Input* [6]



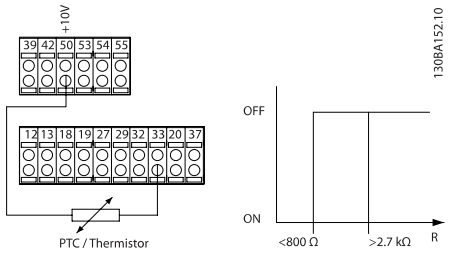
Using a digital input and 10 V as power supply:

Example: The frequency converter trips when the motor temperature is too high.

Parameter set-up:

Set par. F-10 *Electronic Overload* to *Thermistor Trip* [2]

Set par. F-12 *Motor Thermistor Input* to *Digital Input* [6]



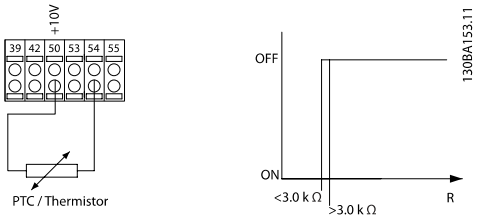
Using an analog input and 10 V as power supply:

Example: The frequency converter trips when the motor temperature is too high.

Parameter set-up:

Set par. F-10 *Electronic Overload* to *Thermistor Trip* [2]

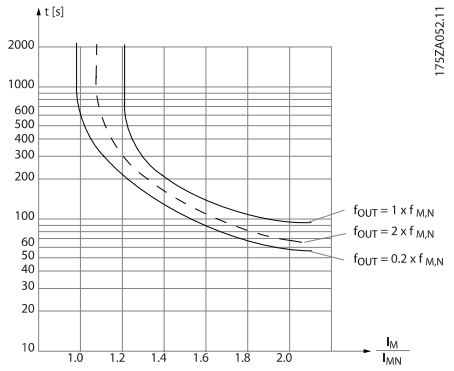
Set par. F-12 *Motor Thermistor Input* to *Analog Input 54* [2]



Input	Supply Voltage	Threshold
Digital/analog	Volt	Cut-out Values
Digital	24 V	< 6.6 kΩ - > 10.8 kΩ
Digital	10 V	< 800Ω - > 2.7 kΩ
Analog	10 V	< 3.0 kΩ - > 3.0 kΩ

NB!
Check that the chosen supply voltage follows the specification of the used thermistor element.

Select *Electronic Overload Warning 1-4*, to activate a warning on the display when the motor is overloaded.
Select *Electronic Overload Trip 1-4* to trip the frequency converter when the motor is overloaded.
Program a warning signal via one of the digital outputs. The signal appears in the event of a warning and if the frequency converter trips (thermal warning).
Electronic Overload functions 1-4 will calculate the load when the set-up where they were selected is active. For example Electronic Overload 3 starts calculating when set-up 3 is selected. For the North American market: The Electronic Overload functions provide class 20 motor overload protection in accordance with NEC.



F-15 Motor Speed High Limit [Hz]

Range:	Function:
50/60.0 Hz* [par. F-16 - par. F-03 Hz]	

NB!
Max. output frequency cannot exceed 10% of the carrier frequency (par. F-26 *Motor Noise (Carrier Freq)*).

F-16 Motor Speed Low Limit [Hz]

Range:	Function:
0 Hz* [0.0 - par. F-15 Hz]	

F-17 Motor Speed High Limit [RPM]

Range:	Function:
3600. RPM* [par. F-18 - 60000. RPM]	

NB!
Max. output frequency cannot exceed 10% of the carrier frequency (par. F-26 *Motor Noise (Carrier Freq)*).

F-18 Motor Speed Low Limit [RPM]

Range:	Function:
0 RPM* [0 - par. F-17 RPM]	

H-08 Reverse Lock		
Option:		**Function:**
		Select the motor speed direction(s) required. Use this parameter to prevent unwanted reversing. When par. H-40 *Configuration Mode* is set to *Process* [3], par. H-08 *Reverse Lock* is set to *Clockwise* [0] as default. The setting in par. H-08 *Reverse Lock* does not limit options for setting par. F-15 *Motor Speed High Limit [Hz]* or par. F-17 *Motor Speed High Limit [RPM]*. This parameter cannot be adjusted while the motor is running.
[0] *	Clockwise	The reference is set to CW rotation. Reversing input (Default term 19) must be open.
[1]	Counter clockwise	The reference is set to CCW rotation. Reversing input (Default term 19) must be closed. If Reversing is required with 'Reverse' input is open the motor direction can be changed by par. H-48 *Clockwise Direction*
[2]	Both directions	Allows the motor to rotate in both directions.

P-04 Auto Tune		
Option:		**Function:**
		The Auto Tune function optimises dynamic motor performance by automatically optimising the advanced motor parameters (par. P-30 *Stator Resistance (Rs)* to par. P-35 *Main Reactance (Xh)*) at motor standstill. Activate the Auto Tune function by pressing [Hand] after selecting [1] or [2]. See also the section *Auto Tuning* in the AF-650 GP Design Guide. After a normal sequence, the display will read: "Press [OK] to finish Auto Tune". After pressing the [OK] key the frequency converter is ready for operation. This parameter cannot be adjusted while the motor is running.
[0] *	Off	
[1]	Full Auto Tune	Performs Auto Tune of the stator resistance R_S, the rotor resistance R_r, the stator leakage reactance X_1, the rotor leakage reactance X_2 and the main reactance X_h. Do *not* select this option if an LC filter is used between the frequency converter and the motor. AF-650 GP: The Full Auto Tune does not include X_h measurement for AF-650 GP. Instead, the X_h value is determined from the motor database. R_S is the best adjustment method (see *P-3# Adv. Motor Data*). Drives rated at 460V 350HP and above and at 575V 125HP and above will only run a Reduced Auto Tune when the Full Auto Tune is selected. It is recommended to obtain the Advanced Motor Data from the motor manufacturer to enter into par. P-31 through P-36 for best performance.
[2]	Reduced Auto Tune	Performs a reduced Auto Tune of the stator resistance R_s in the system only.

Note:

- For the best results run Auto Tune on a cold motor.
- Auto Tune cannot be performed while the motor is running.
- Auto Tune cannot be performed on permanent magnet motors.

NB!
It is important to set motor par. F-04, F-05, and P-02 to P-08 correctly, since these form part of the Auto Tune algorithm. An Auto Tune should be performed to achieve optimum dynamic motor performance. It may take up to 10 min, depending on the power rating of the motor.

NB!
Avoid generating external torque during Auto Tune.

NB!
If one of the settings in par. F-04, F-05, or P-02 to P-08 is changed, par. P-30 *Stator Resistance (Rs)* to par. P-01 *Motor Poles*, the advanced motor parameters, will return to default setting.

NB!
Auto Tune will work problem-free on 1 motor size down, typically work on 2 motor sizes down, rarely work on 3 sizes down and never work on 4 sizes down. Please keep in mind that the accuracy of the measured motor data will be poorer when you operate on motors smaller than nominal drive size.

4.3 Parameter Lists

Changes during operation

"TRUE" means that the parameter can be changed while the frequency converter is in operation and "FALSE" means that the frequency converter must be stopped before a change can be made.

4-Set-up

'All set-ups': the parameter can be set individually in each of the four set-ups, i. e. one single parameter can have four different data values.

'1 set-up': data value will be the same in all set-ups.

4

Conversion index

This number refers to a conversion figure used when writing or reading by means of a frequency converter.

Conv. index	100	67	6	5	4	3	2	1	0	-1	-2	-3	-4	-5	-6
Conv. factor	1	1/60	1000000	100000	10000	1000	100	10	1	0.1	0.01	0.001	0.0001	0.00001	0.000001

Data type	**Description**	**Type**
2	Integer 8	Int8
3	Integer 16	Int16
4	Integer 32	Int32
5	Unsigned 8	Uint8
6	Unsigned 16	Uint16
7	Unsigned 32	Uint32
9	Visible String	VisStr
33	Normalized value 2 bytes	N2
35	Bit sequence of 16 boolean variables	V2
54	Time difference w/o date	TimD

4.3.1 K-## Keypad Set-up

5 General Specifications

Mains supply (L1, L2, L3):	
Supply voltage	380-480 V ±10%
Supply voltage	525-690 V ±10%

Mains voltage low / mains drop-out:

During low mains voltage or a mains drop-out, the drive continues until the intermediate circuit voltage drops below the minimum stop level, which corresponds typically to 15% below the drive's lowest rated supply voltage. Power-up and full torque cannot be expected at mains voltage lower than 10% below the drive's lowest rated supply voltage.

Supply frequency	50/60 Hz ±5%
Max. imbalance temporary between mains phases	3.0 % of rated supply voltage
True Power Factor (λ)	≥ 0.9 nominal at rated load
Displacement Power Factor (cos ϕ) near unity	(> 0.98)
Switching on input supply L1, L2, L3 (power-ups)	maximum 1 time/ 2 min.
Environment according to EN60664-1	over-voltage category III/pollution degree 2

The unit is suitable for use on a circuit capable of delivering not more than 100.000 RMS symmetrical Amperes, 500/600/690 V maximum.

Motor output (U, V, W):	
Output voltage	0 - 100% of supply voltage
Output frequency	0 - 800* Hz
Switching on output	Unlimited
Ramp times	0.01 - 3600 sec.

** Voltage and power dependent*

Torque characteristics:	
Starting torque (Constant torque)	maximum 160% for 60 sec.*
Starting torque	maximum 180% up to 0.5 sec.*
Overload torque (Constant torque)	maximum 160% for 60 sec.*
Starting torque (Variable torque)	maximum 110% for 60 sec.*
Overload torque (Variable torque)	maximum 110% for 60 sec.

**Percentage relates to the nominal torque.*

Digital inputs:	
Programmable digital inputs	4 (6)
Terminal number	18, 19, 27[1], 29, 32, 33,
Logic	PNP or NPN
Voltage level	0 - 24 V DC
Voltage level, logic'0' PNP	< 5 V DC
Voltage level, logic'1' PNP	> 10 V DC
Voltage level, logic '0' NPN[2]	> 19 V DC
Voltage level, logic '1' NPN[2]	< 14 V DC
Maximum voltage on input	28 V DC
Pulse frequency range	0 - 110 kHz
(Duty cycle) Min. pulse width	4.5 ms
Input resistance, R_i	approx. 4 kΩ

Safe stop Terminal 37[3] (Terminal 37 is fixed PNP logic):	
Voltage level	0 - 24 V DC
Voltage level, logic'0' PNP	< 4 V DC
Voltage level, logic'1' PNP	>20 V DC
Nominal input current at 24 V	50 mA rms
Nominal input current at 20 V	60 mA rms
Input capacitance	400 nF

All digital inputs are galvanically isolated from the supply voltage (PELV) and other high-voltage terminals.

1) Terminals 27 and 29 can also be programmed as output.

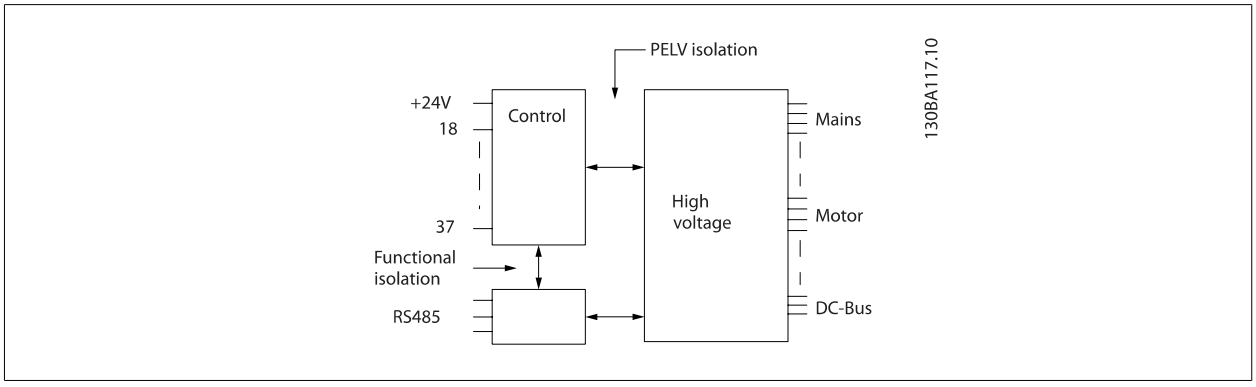
2) Except safe stop input Terminal 37.

3) Terminal 37 can only be used as safe stop input. Terminal 37 is suitable for category 3 installations according to EN 954-1 (safe stop according to category 0 EN 60204-1) as required by the EU Machinery Directive 98/37/EC. Terminal 37 and the Safe Stop function are designed in conformance with EN 60204-1, EN 50178, EN 61800-2, EN 61800-3, and EN 954-1. For correct and safe use of the Safe Stop function follow the related information and instructions in the AF-650 GP Design Guide.

5

Analog inputs:	
Number of analog inputs	2
Terminal number	53, 54
Modes	Voltage or current
Mode select	Switch S201 and switch S202
Voltage mode	Switch S201/switch S202 = OFF (U)
Voltage level	-10 to +10 V (scaleable)
Input resistance, R_i	approx. 10 kΩ
Max. voltage	± 20 V
Current mode	Switch S201/switch S202 = ON (I)
Current level	0/4 to 20 mA (scaleable)
Input resistance, R_i	approx. 200 Ω
Max. current	30 mA
Resolution for analog inputs	10 bit (+ sign)
Accuracy of analog inputs	Max. error 0.5% of full scale
Bandwidth	100 Hz

The analog inputs are galvanically isolated from the supply voltage (PELV) and other high-voltage terminals.



Pulse/encoder inputs:	
Programmable pulse/encoder inputs	2/1
Terminal number pulse/encoder	29, 33[1] / 32[2], 33[2]
Max. frequency at terminal 29, 32, 33	110 kHz (Push-pull driven)
Max. frequency at terminal 29, 32, 33	5 kHz (open collector)
Min. frequency at terminal 29, 32, 33	4 Hz
Voltage level	see section on Digital input
Maximum voltage on input	28 V DC
Input resistance, R_i	approx. 4 kΩ
Pulse input accuracy (0.1 - 1 kHz)	Max. error: 0.1% of full scale
Encoder input accuracy (1 - 110 kHz)	Max. error: 0.05 % of full scale

The pulse and encoder inputs (terminals 29, 32, 33) are galvanically isolated from the supply voltage (PELV) and other high-voltage terminals.

1) Pulse inputs are 29 and 33

2) Encoder inputs: 32 = A, and 33 = B

5

Digital output:	
Programmable digital/pulse outputs	2
Terminal number	27, 29 [1]
Voltage level at digital/frequency output	0 - 24 V
Max. output current (sink or source)	40 mA
Max. load at frequency output	1 kΩ
Max. capacitive load at frequency output	10 nF
Minimum output frequency at frequency output	0 Hz
Maximum output frequency at frequency output	32 kHz
Accuracy of frequency output	Max. error: 0.1 % of full scale
Resolution of frequency outputs	12 bit

1) Terminal 27 and 29 can also be programmed as input.

The digital output is galvanically isolated from the supply voltage (PELV) and other high-voltage terminals.

Analog output:	
Number of programmable analog outputs	1
Terminal number	42
Current range at analog output	0/4 - 20 mA
Max. load GND - analog output	500 Ω
Accuracy on analog output	Max. error: 0.5 % of full scale
Resolution on analog output	12 bit

The analog output is galvanically isolated from the supply voltage (PELV) and other high-voltage terminals.

Control card, 24 V DC output:	
Terminal number	12, 13
Output voltage	24 V +1, -3 V
Max. load	200 mA

The 24 V DC supply is galvanically isolated from the supply voltage (PELV), but has the same potential as the analog and digital inputs and outputs.

Control card, 10 V DC output:	
Terminal number	50
Output voltage	10.5 V ±0.5 V
Max. load	15 mA

The 10 V DC supply is galvanically isolated from the supply voltage (PELV) and other high-voltage terminals.

Control card, RS 485 serial communication:	
Terminal number	68 (P,TX+, RX+), 69 (N,TX-, RX-)
Terminal number 61	Common for terminals 68 and 69

The RS 485 serial communication circuit is functionally separated from other central circuits and galvanically isolated from the supply voltage (PELV).

Control card, USB serial communication:	
USB standard	1.1 (Full speed)
USB plug	USB type B "device" plug

Connection to PC is carried out via a standard host/device USB cable.

The USB connection is galvanically isolated from the supply voltage (PELV) and other high-voltage terminals.

The USB ground connection is not galvanically isolated from protection earth. Use only an isolated laptop as PC connection to the USB connector on the frequency converter.

Relay outputs:	
Programmable relay outputs	2
Relay 01 Terminal number	1-3 (break), 1-2 (make)
Max. terminal load (AC-1)[1)] on 1-3 (NC), 1-2 (NO) (Resistive load)	240 V AC, 2 A
Max. terminal load (AC-15)[1)] (Inductive load @ cosϕ 0.4)	240 V AC, 0.2 A
Max. terminal load (DC-1)[1)] on 1-2 (NO), 1-3 (NC) (Resistive load)	60 V DC, 1A
Max. terminal load (DC-13)[1)] (Inductive load)	24 V DC, 0.1A
Relay 02 Terminal number	4-6 (break), 4-5 (make)
Max. terminal load (AC-1)[1)] on 4-5 (NO) (Resistive load)	400 V AC, 2 A
Max. terminal load (AC-15)[1)] on 4-5 (NO) (Inductive load @ cosϕ 0.4)	240 V AC, 0.2 A
Max. terminal load (DC-1)[1)] on 4-5 (NO) (Resistive load)	80 V DC, 2 A
Max. terminal load (DC-13)[1)] on 4-5 (NO) (Inductive load)	24 V DC, 0.1A
Max. terminal load (AC-1)[1)] on 4-6 (NC) (Resistive load)	240 V AC, 2 A
Max. terminal load (AC-15)[1)] on 4-6 (NC) (Inductive load @ cosϕ 0.4)	240 V AC, 0.2A
Max. terminal load (DC-1)[1)] on 4-6 (NC) (Resistive load)	50 V DC, 2 A
Max. terminal load (DC-13)[1)] on 4-6 (NC) (Inductive load)	24 V DC, 0.1 A
Min. terminal load on 1-3 (NC), 1-2 (NO), 4-6 (NC), 4-5 (NO)	24 V DC 10 mA, 24 V AC 20 mA
Environment according to EN 60664-1	over-voltage category III/pollution degree 2

1) IEC 60947 part 4 and 5

The relay contacts are galvanically isolated from the rest of the circuit by reinforced isolation (PELV).

Cable lengths and cross sections:	
Max. motor cable length, screened/armoured	150 m
Max. motor cable length, unscreened/unarmoured	300 m
Maximum cross section to control terminals, flexible/ rigid wire without cable end sleeves	1.5 mm^2/16 AWG
Maximum cross section to control terminals, flexible wire with cable end sleeves	1 mm^2/18 AWG
Maximum cross section to control terminals, flexible wire with cable end sleeves with collar	0.5 mm^2/20 AWG
Minimum cross section to control terminals	0.25 mm^2/ 24 AWG
Control card performance:	
Scan interval	1 ms
Control characteristics:	
Resolution of output frequency at 0 - 1000 Hz	+/- 0.003 Hz
Repeat accuracy of *Precise start/stop* (terminals 18, 19)	≤± 0.1 msec
System response time (terminals 18, 19, 27, 29, 32, 33)	≤ 2 ms
Speed control range (open loop)	1:100 of synchronous speed
Speed control range (closed loop)	1:1000 of synchronous speed
Speed accuracy (open loop)	30 - 4000 rpm: error ±8 rpm
Speed accuracy (closed loop), depending on resolution of feedback device	0 - 6000 rpm: error ±0.15 rpm

All control characteristics are based on a 4-pole asynchronous motor

Surroundings:	
Enclosure, frame size 4X and 5X	IP00 Open Chassis, IP21/Nema 1, and IP54/Nema 12
Enclosure, frame size 5X	IP21/Nema 1, and IP54/Nema 12
Vibration test	0.7 g
Max. relative humidity	5% - 95%(IEC 721-3-3; Class 3K3 (non-condensing) during operation
Aggressive environment (IEC 60068-2-43	class $H_2$5
Ambient temperature (with SFAVM switching mode)	
- with derating	Max. 55 °C[1)]
- at full continuous drive output current	Max. 45 °C[1)]

1) For more information on derating, see special conditions in the AF-650 GP Design Guide

Minimum ambient temperature during full-scale operation	0 °C
Minimum ambient temperature at reduced performance	- 10 °C
Temperature during storage/transport	-25 - +65/70 °C
Maximum altitude above sea level without derating	1000 m

Derating for high altitude, see special conditions in the AF-650 GP Design Guide

EMC standards, Emission	EN 61800-3, EN 61000-6-3/4, EN 55011
EMC standards, Immunity	EN 61800-3, EN 61000-6-1/2, EN 61000-4-2, EN 61000-4-3, EN 61000-4-4, EN 61000-4-5, EN 61000-4-6

See section on special conditions in the AF-650 GP Design Guide Please see www.geelectrical.com/drives for more information.

Protection and Features:

- Electronic thermal motor protection against overload.
- Temperature monitoring of the heatsink ensures that the frequency converter trips if the temperature reaches a predefined level. An overload temperature cannot be reset until the temperature of the heatsink is below the values stated in the tables on the following pages (Guideline - these temperatures may vary for different power sizes, Unit Sizes, enclosure ratings etc.).
- The frequency converter is protected against short-circuits on motor terminals U, V, W.
- If a mains phase is missing, the frequency converter trips or issues a warning (depending on the load).
- Monitoring of the intermediate circuit voltage ensures that the frequency converter trips if the intermediate circuit voltage is too low or too high.
- The frequency converter constantly checks for critical levels of internal temperature, load current, high voltage on the intermediate circuit and low motor speeds. As a response to a critical level, the frequency converter can adjust the switching frequency and/ or change the switching pattern in order to ensure the performance of the drive.

Mains Supply 3 x 380 - 480 VAC

* Heavy Duty = 160% torque during 60 s, Light Duty = 110% torque during 60 s

1) For type of fuse see section *Fuses*.

2) American Wire Gauge.

3) Measured using 5 m screened motor cables at rated load and rated frequency.

4) The typical power loss is at nominal load conditions and expected to be within +/-15% (tolerence relates to variety in voltage and cable conditions). Values are based on a typical motor efficiency (eff2/eff3 border line). Motors with lower efficiency will also add to the power loss in the frequency converter and opposite.

If the switching frequency is increased compared to the default setting, the power losses may rise significantly.

Keypad and typical control card power consumptions are included. Further options and customer load may add up to 30W to the losses. (Though typical only 4W extra for a fully loaded control card, or options for slot A or slot B, each).

Although measurements are made with state of the art equipment, some measurement inaccuracy must be allowed for (+/-5%).

6

6 Warnings and Alarms

6.1 Status Messages

6.1.1 Warnings/Alarm Messages

A warning or an alarm is signalled by the relevant LED on the front of the frequency converter and indicated by a code on the display.

A warning remains active until its cause is no longer present. Under certain circumstances operation of the motor may still be continued. Warning messages may be critical, but are not necessarily so.

In the event of an alarm, the frequency converter will have tripped. Alarms must be reset to restart operation once their cause has been rectified.

This may be done in three ways:

1. By using the [RESET] control button on the Keypad.
2. Via a digital input with the "Reset" function.
3. Via serial communication/optional network.

NB!
After a manual reset using the [RESET] button on the Keypad, the [AUTO] button must be pressed to restart the motor.

If an alarm cannot be reset, the reason may be that its cause has not been rectified, or the alarm is trip-locked (see also table on following page).

Alarms that are trip-locked offer additional protection, meaning that the mains supply must be switched off before the alarm can be reset. After being switched back on, the frequency converter is no longer blocked and may be reset as described above once the cause has been rectified.

Alarms that are not trip-locked can also be reset using the automatic reset function in par. H-04 *Auto-Reset (Times)* (Warning: automatic wake-up is possible!)

If a warning and alarm is marked against a code in the table on the following page, this means that either a warning occurs before an alarm, or else that you can specify whether it is a warning or an alarm that is to be displayed for a given fault.

This is possible, for instance, in par. F-10 *Electronic Overload*. After an alarm or trip, the motor carries on coasting, and the alarm and warning flash. Once the problem has been rectified, only the alarm continues flashing until the frequency converter is reset.

Table 6.2: Alarm/Warning code list

(X) Dependent on parameter

1) Can not be Auto reset via par. H-04 *Auto-Reset (Times)*

A trip is the action when an alarm has appeared. The trip will coast the motor and can be reset by pressing the reset button or make a reset by a digital input (par. group E-1# [1]). The origin event that caused an alarm cannot damage the frequency converter or cause dangerous conditions. A trip lock is an action when an alarm occurs, which may cause damage to frequency converter or connected parts. A Trip Lock situation can only be reset by a power cycling.

LED indication

Warning	yellow
Alarm	flashing red
Trip locked	yellow and red

Alarm Word Extended Status Word

Table 6.3: Description of Alarm Word, Warning Word and Extended Status Word

The alarm words, warning words and extended status words can be read out via serial bus or optional network for diagnose. See also par. DR-94 *Ext. Status Word*.

WARNING 1, 10 volts low

The control card voltage is below 10 V from terminal 50.

Remove some of the load from terminal 50, as the 10 V supply is overloaded. Max. 15 mA or minimum 590 Ω.

This condition can be caused by a short in a connected potentiometer or improper wiring of the potentiometer.

Troubleshooting: Remove the wiring from terminal 50. If the warning clears, the problem is with the customer wiring. If the warning does not clear, replace the control card.

WARNING/ALARM 2, Live zero error

This warning or alarm will only appear if programmed by the user in par. AN-01 *Live Zero Timeout Function*. The signal on one of the analog inputs is less than 50% of the minimum value programmed for that input. This condition can be caused by broken wiring or faulty device sending the signal.

WARNING/ALARM 3, No motor

No motor has been connected to the output of the frequency converter. This warning or alarm will only appear if programmed by the user in par. H-80 *Function at Stop*.

Troubleshooting: Check the connection between the drive and the motor.

WARNING/ALARM 4, Mains phase loss

A phase is missing on the supply side, or the mains voltage imbalance is too high. This message also appears for a fault in the input rectifier on the frequency converter. Options are programmed at par. SP-12 *Function at Line Imbalance*.

Troubleshooting: Check the supply voltage and supply currents to the frequency converter.

WARNING 5, DC link voltage high

The intermediate circuit voltage (DC) is higher than the high voltage warning limit. The limit is dependent on the drive voltage rating. The frequency converter is still active.

WARNING 6, DC link voltage low

The intermediate circuit voltage (DC) is lower than the low voltage warning limit. The limit is dependent on the drive voltage rating. The frequency converter is still active.

WARNING/ALARM 7, DC overvoltage

If the intermediate circuit voltage exceeds the limit, the frequency converter trips after a time.

Troubleshooting:

Connect a brake resistor

Extend the ramp time

Change the ramp type

Activate functions in par. B-10 *Brake Function*

Increase par. SP-26 *Trip Delay at Drive Fault*

WARNING/ALARM 8, DC under voltage

If the intermediate circuit voltage (DC) drops below the under voltage limit, the frequency converter checks if a 24 V backup supply is connected. If no 24 V backup supply is connected, the frequency converter trips after a fixed time delay. The time delay varies with unit size.

WARNING/ALARM 9, Inverter overloaded

The frequency converter is about to cut out because of an overload (too high current for too long). The counter for electronic, thermal inverter protection gives a warning at 98% and trips at 100%, while giving an alarm. The frequency converter *cannot* be reset until the counter is below 90%.

The fault is that the frequency converter is overloaded by more than 100% for too long. Note: See the derating section in the Design Guide for more details if a high switching frequency is required.

WARNING/ALARM 10, Motor overload temperature

According to the electronic thermal protection, the motor is too hot. Select whether the frequency converter gives a warning or an alarm when the counter reaches 100% in par. F-10 *Electronic Overload*. The fault is that the motor is overloaded by more than 100% for too long.

Troubleshooting:

Check if motor is over heating.

If the motor is mechanically overloaded

That the motor par. P-03 *Motor Current* is set correctly.

Motor data in par. P-07 *Motor Power [kW]* through par. P-06 *Base Speed* are set correctly.

The setting in par. F-11 *Motor External Fan*.

Run Auto Tune in par. P-04 *Auto Tune*.

WARNING/ALARM 11, Motor thermistor over temp

The thermistor or the thermistor connection is disconnected. Select whether the frequency converter gives a warning or an alarm when the counter reaches 100% in par. F-10 *Electronic Overload*.

Troubleshooting:

Check if motor is over heating.

Check if the motor is mechanically overloaded.

Check that the thermistor is connected correctly between terminal 53 or 54 (analog voltage input) and terminal 50 (+10 V supply), or between terminal 18 or 19 (digital input PNP only) and terminal 50.

If a KTY sensor is used, check for correct connection between terminal 54 and 55.

If using a thermal switch or thermistor, check the programming of par. F-12 *Motor Thermistor Input* matches sensor wiring.

If using a KTY sensor, check the programming of par. H-95 *KTY Sensor Type*, par. H-96 *KTY Thermistor Input*, and par. H-97 *KTY Threshold level* match sensor wiring.

WARNING/ALARM 12, Torque limit

The torque is higher than the value in par. F-40 *Torque Limiter (Driving)* (in motor operation) or the torque is higher than the value in par. F-41 *Torque Limiter (Braking)* (in regenerative operation). par. SP-25 *Trip Delay at Torque Limit* can be used to change this from a warning only condition to a warning followed by an alarm.

WARNING/ALARM 13, Over Current

The inverter peak current limit (approx. 200% of the rated current) is exceeded. The warning lasts about 1.5 sec., then the frequency converter trips and issues an alarm. If extended mechanical brake control is selected, trip can be reset externally.

Troubleshooting:

This fault may be caused by shock loading or fast acceleration with high inertia loads.

Turn off the frequency converter. Check if the motor shaft can be turned.

Check that the motor size matches the frequency converter.

Incorrect motor data in par. P-07 *Motor Power [kW]* through par. P-06 *Base Speed*.

ALARM 14, Earth (ground) fault

There is a discharge from the output phases to earth, either in the cable between the frequency converter and the motor or in the motor itself.

Troubleshooting:

Turn off the frequency converter and remove the earth fault.

Measure the resistance to ground of the motor leads and the motor with a megohmmeter to check for earth faults in the motor.

Perform current sensor test.

ALARM 15, Hardware mismatch

A fitted option is not operational with the present control board hardware or software.

Record the value of the following parameters and contact your GE supplier:

par. ID-40 *Drive Type*

par. ID-41 *Power Section*

par. ID-42 *Voltage*

par. ID-43 *Software Version*

par. ID-45 *Actual Typecode String*

par. ID-49 *SW ID Control Card*

par. ID-50 *SW ID Power Card*

par. ID-60 *Option Mounted*

par. ID-61 *Option SW Version*

ALARM 16, Short circuit

There is short-circuiting in the motor or on the motor terminals.
Turn off the frequency converter and remove the short-circuit.

WARNING/ALARM 17, Control word timeout

There is no communication to the frequency converter.
The warning will only be active when par. O-04 *Control Word Timeout Function* is NOT set to OFF.
If par. O-04 *Control Word Timeout Function* is set to *Stop* and *Trip*, a warning appears and the frequency converter decels until it trips, while giving an alarm.

Troubleshooting:

Check connections on the serial communication cable.

Increase par. O-03 *Control Word Timeout Time*

Check operation of the communication equipment.

Verify proper installation based on EMC requirements.

WARNING 22, Hoist Mech. Brake:

Report value will show what kind it is.
0 = The torque ref. was not reached before timeout.
1 = There was no brake feedback before timeout.

WARNING 23, Internal fan fault

The fan warning function is an extra protection function that checks if the fan is running / mounted. The fan warning can be disabled in par. SP-53 *Fan Monitor* ([0] Disabled).

For the unit sizes 4X, 5X and 6X, the regulated voltage to the fans is monitored.

Troubleshooting:

Check fan resistance.

Check soft charge fuses.

WARNING 24, External fan fault

The fan warning function is an extra protection function that checks if the fan is running / mounted. The fan warning can be disabled in par. SP-53 *Fan Monitor* ([0] Disabled).

For the unit sizes 4X, 5X and 6X, the regulated voltage to the fans is monitored.

Troubleshooting:

Check fan resistance.

Check soft charge fuses.

WARNING 25, Brake resistor short circuit

The brake resistor is monitored during operation. If it short circuits, the brake function is disconnected and the warning appears. The frequency converter still works, but without the brake function. Turn off the frequency converter and replace the brake resistor (see par. B-15 *Brake Check*).

WARNING/ALARM 26, Brake resistor power limit

The power transmitted to the brake resistor is calculated: as a percentage, as a mean value over the last 120 seconds, on the basis of the resistance value of the brake resistor, and the intermediate circuit voltage. The warning is active when the dissipated braking power is higher than 90%. If *Trip* [2] has been selected in par. B-13 *Braking Thermal Overload*, the frequency converter cuts out and issues this alarm, when the dissipated braking power is higher than 100%.

Warning: There is a risk of substantial power being transmitted to the brake resistor if the brake transistor is short-circuited.

WARNING/ALARM 27, Brake chopper fault

The brake transistor is monitored during operation and if it short-circuits, the brake function disconnects and issues a warning. The frequency converter is still able to run, but since the brake transistor has short-circuited, substantial power is transmitted to the brake resistor, even if it is inactive.
Turn off the frequency converter and remove the brake resistor.
This alarm/ warning could also occur should the brake resistor overheat. Terminal 104 to 106 are available as brake resistor. Klixon inputs, see section Brake Resistor Temperature Switch.

WARNING/ALARM 28, Brake check failed

Brake resistor fault: the brake resistor is not connected or not working.
Check par. B-15 *Brake Check*.

ALARM 29, Heatsink temp

The maximum temperature of the heatsink has been exceeded. The temperature fault will not be reset until the temperature falls below a defined heatsink temperature. The trip and reset point are different based on the drive power size.

Troubleshooting:

Ambient temperature too high.

Too long motor cable.

Incorrect clearance above and below the drive.

Dirty heatsink.

Blocked air flow around the drive.

Damaged heatsink fan.

For the unit sizes 4X, 5X and 6X, this alarm is based on the temperature measured by the heatsink sensor mounted inside the IGBT modules. For the unit sizes 6X, this alarm can also be caused by the thermal sensor in the Rectifier module.

Troubleshooting:

Check fan resistance.

Check soft charge fuses.

IGBT thermal sensor.

ALARM 30, Motor phase U missing

Motor phase U between the frequency converter and the motor is missing. Turn off the frequency converter and check motor phase U.

ALARM 31, Motor phase V missing

Motor phase V between the frequency converter and the motor is missing. Turn off the frequency converter and check motor phase V.

ALARM 32, Motor phase W missing

Motor phase W between the frequency converter and the motor is missing. Turn off the frequency converter and check motor phase W.

ALARM 33, Inrush fault

Too many power-ups have occurred within a short time period. Let unit cool to operating temperature.

WARNING/ALARM 34, Network communication fault

The network on the communication option card is not working.

WARNING/ALARM 36, Mains failure

This warning/alarm is only active if the supply voltage to the frequency converter is lost and par. SP-10 *Line failure* is NOT set to OFF. Check the fuses to the frequency converter

ALARM 38, Internal fault

It may be necessary to contact your GE supplier. Some typical alarm messages:

0	Serial port cannot be initialized. Serious hardware failure
256-258	Power EEPROM data is defect or too old
512	Control board EEPROM data is defect or too old
513	Communication time out reading EEPROM data
514	Communication time out reading EEPROM data
515	Application Orientated Control cannot recognize the EEPROM data
516	Cannot write to the EEPROM because a write command is on progress
517	Write command is under time out
518	Failure in the EEPROM
519	Missing or invalid Barcode data in EEPROM
783	Parameter value outside of min/max limits
1024-1279	A cantelegram that has to be sent, couldn't be sent
1281	Digital Signal Processor flash timeout
1282	Power micro software version mismatch
1283	Power EEPROM data version mismatch
1284	Cannot read Digital Signal Processor software version
1299	Option SW in slot A is too old
1300	Option SW in slot B is too old
1301	Option SW in slot C0 is too old
1302	Option SW in slot C1 is too old
1315	Option SW in slot A is not supported (not allowed)
1316	Option SW in slot B is not supported (not allowed)
1317	Option SW in slot C0 is not supported (not allowed)
1318	Option SW in slot C1 is not supported (not allowed)
1379	Option A did not respond when calculating Platform Version.
1380	Option B did not respond when calculating Platform Version.
1381	Option C0 did not respond when calculating Platform Version.
1382	Option C1 did not respond when calculating Platform Version.
1536	An exception in the Application Orientated Control is registered. Debug information written in Keypad
1792	DSP watchdog is active. Debugging of power part data Motor Orientated Control data not transferred correctly
2049	Power data restarted
2064-2072	H081x: option in slot x has restarted
2080-2088	H082x: option in slot x has issued a powerup-wait
2096-2104	H083x: option in slot x has issued a legal powerup-wait
2304	Could not read any data from power EEPROM
2305	Missing SW version from power unit
2314	Missing power unit data from power unit
2315	Missing SW version from power unit
2316	Missing io_statepage from power unit
2324	Power card configuration is determined to be incorrect at power up
2325	A power card has stopped communicating while main power is applied
2326	Power card configuration is determined to be incorrect after the delay for power cards to register
2327	Too many power card locations have been registered as present
2330	Power size information between the power cards does not match
2561	No communication from DSP to ATACD
2562	No communication from ATACD to DSP (state running)
2816	Stack overflow Control board module
2817	Scheduler slow tasks
2818	Fast tasks
2819	Parameter thread
2820	Keypad Stack overflow
2821	Serial port overflow
2822	USB port overflow
2836	cfListMempool to small
3072-5122	Parameter value is outside its limits
5123	Option in slot A: Hardware incompatible with Control board hardware
5124	Option in slot B: Hardware incompatible with Control board hardware
5125	Option in slot C0: Hardware incompatible with Control board hardware
5126	Option in slot C1: Hardware incompatible with Control board hardware
5376-6231	Out of memory

ALARM 39, Heatsink sensor

No feedback from the heatsink temperature sensor.

The signal from the IGBT thermal sensor is not available on the power card. The problem could be on the power card, on the gate drive card, or the ribbon cable between the power card and gate drive card.

WARNING 40, Overload of Digital Output Terminal 27

Check the load connected to terminal 27 or remove short-circuit connection. Check par. E-00 *Digital I/O Mode* and par. E-51 *Terminal 27 Mode*.

WARNING 41, Overload of Digital Output Terminal 29

Check the load connected to terminal 29 or remove short-circuit connection. Check par. E-00 *Digital I/O Mode* and par. E-52 *Terminal 29 Mode*.

WARNING 42, Overload of Digital Output on X30/6 or Overload of Digital Output on X30/7

For X30/6, check the load connected to X30/6 or remove short-circuit connection. Check par. E-56 X30/6 Digital Out (OPCGPIO).

For X30/7, check the load connected to X30/7 or remove short-circuit connection. Check par. E-57 Term X30/7 Digital Out (OPCGPIO).

ALARM 46, Power card supply

The supply on the power card is out of range.

There are three power supplies generated by the switch mode power supply (SMPS) on the power card: 24 V, 5V, +/- 18V. When powered with 24 VDC with the OPC24VPS 24 V DC External Supply Module, only the 24 V and 5 V supplies are monitored. When powered with three phase mains voltage, all three supplied are monitored.

WARNING 47, 24 V supply low

The 24 VDC is measured on the control card. The external 24 VDC backup power supply may be overloaded, otherwise contact your GE supplier.

WARNING 48, 1.8 V supply low

The 1.8 Volt DC supply used on the control card is outside of allowable limits. The power supply is measured on the control card.

WARNING 49, Speed limit

The speed is not within the specified range in par. F-18 *Motor Speed Low Limit [RPM]* and par. F-17 *Motor Speed High Limit [RPM]*.

ALARM 50, Auto tune calibration failed

Contact your GE supplier.

ALARM 51, Auto tune check Unom and Inom

The setting of motor voltage, motor current, and motor power is presumably wrong. Check the settings.

ALARM 52, Auto tune low Inom

The motor current is too low. Check the settings.

ALARM 53, Auto tune motor too big

The motor is too big for the Auto tune to be carried out.

ALARM 54, Auto tune motor too small

The motor is too big for the Auto tune to be carried out.

ALARM 55, Auto tune parameter out of range
The parameter values found from the motor are outside acceptable range.

ALARM 56, Auto tune interrupted by user
The Auto tune has been interrupted by the user.

ALARM 57, Auto tune timeout
Try to start the Auto tune again a number of times, until the Auto tune is carried out. Please note that repeated runs may heat the motor to a level where the resistance Rs and Rr are increased. In most cases, however, this is not critical.

ALARM 58, Auto tune internal fault
Contact your GE supplier.

WARNING 59, Current limit
The current is higher than the value in par. F-43 *Current Limit*.

WARNING 60, External interlock
External interlock has been activated. To resume normal operation, apply 24 VDC to the terminal programmed for external interlock and reset the frequency converter (via serial communication, digital I/O, or by pressing reset button on keypad).

WARNING 61, Tracking error
An error has been detected between calculated motor speed and speed measurement from feedback device. The function for Warning/Alarm/Disable is set in par. H-20 *Motor Feedback Loss Function*, error setting in par. H-21 *Motor Feedback Speed Error*, and the allowed error time in par. H-22 *Motor Feedback Loss Timeout*. During a commissioning procedure the function may be effective.

WARNING 62, Output frequency at maximum limit
The output frequency is higher than the value set in par. F-03 *Max Output Frequency 1*

WARNING 64, Voltage limit
The load and speed combination demands a motor voltage higher than the actual DC link voltage.

WARNING/ALARM/TRIP 65, Control card over temperature
Control card over temperature: The cutout temperature of the control card is 80° C.

WARNING 66, Heatsink temperature low
This warning is based on the temperature sensor in the IGBT module.

Troubleshooting:

ALARM 67, Option module configuration has changed
One or more options have either been added or removed since the last power-down.

ALARM 68, Safe stop activated
Safe stop has been activated. To resume normal operation, apply 24 VDC to terminal 37, then send a reset signal (via Bus, Digital I/O, or by pressing the reset key. See par. E-07 *Terminal 37 Safe Stop*.

ALARM 69, Power card temperature
The temperature sensor on the power card is either too hot or too cold.

Troubleshooting:

Check the operation of the door fans.

Check that the filters for the door fans are not blocked.

Check that the gland plate is properly installed on IP 21 and IP 54 (NEMA 1 and NEMA 12) drives.

ALARM 70, Illegal Drive Configuration
Actual combination of control board and power board is illegal.

WARNING/ALARM 73, Safe stop auto restart
Safe stopped. Note that with automatic restart enabled, the motor may start when the fault is cleared.

WARNING 76, Power Unit Setup
The required number of power units does not match the detected number of active power units.

Troubleshooting:
When replacing a unit size 6X module this will occur if the power specific data in the module power card does not match the rest of the drive. Please confirm the spare part and its power card are the correct part number.

WARNING 77, Reduced power mode:
This warning indicates that the drive is operating in reduced power mode (i.e. less than the allowed number of inverter sections). This warning will be generated on power cycle when the drive is set to run with fewer inverters and will remain on.

ALARM 79, Illegal power section configuration
The scaling card is the incorrect part number or not installed. Also MK102 connector on the power card could not be installed.

ALARM 80, Drive Restored to Factory Settings
Parameter settings are restored to factory settings after a manual reset.

WARNING 81, CSIV corrupt:
CSIV file has syntax errors.

WARNING 82, CSIV parameter error:
CSIV parameter error

WARNING 85, Dang fail PB:
Profibus/Profisafe Error

ALARM 91, Analog input 54 wrong settings
Switch S202 has to be set in position OFF (voltage input) when a KTY sensor is connected to analog input terminal 54.

ALARM 243, Brake IGBT
This alarm is only for unit sizes 6X. It is equivalent to Alarm 27. The report value in the alarm log indicates which power module generated the alarm:

1 = left most inverter module.

2 = middle inverter module in unit sizes 62 or 64.

2 = right inverter module in unit sizes 61 or 63.

3 = right inverter module in unit sizes 62 or 64.

5 = rectifier module.

ALARM 244, Heatsink temperature
This alarm is only for unit sizes 6X. It is equivalent to Alarm 29. The report value in the alarm log indicates which power module generated the alarm:

1 = left most inverter module.

2 = middle inverter module in unit sizes 62 or 64.

2 = right inverter module in unit sizes 61 or 63.

3 = right inverter module in unit sizes 62 or 64.

5 = rectifier module.

ALARM 245, Heatsink sensor
This alarm is only for unit sizes 6X. It is equivalent to Alarm 39. The report value in the alarm log indicates which power module generated the alarm:

1 = left most inverter module.

2 = middle inverter module in unit sizes 62 or 64.

2 = right inverter module in unit sizes 61 or 63.

3 = right inverter module in unit sizes 62 or 64.

5 = rectifier module.

ALARM 246, Power card supply

This alarm is only for unit sizes 6X. It is equivalent to Alarm 46. The report value in the alarm log indicates which power module generated the alarm:

1 = left most inverter module.

2 = middle inverter module in unit sizes 62 or 64.

2 = right inverter module in unit sizes 61 or 63.

3 = right inverter module in unit sizes 62 or 64.

5 = rectifier module.

ALARM 247, Power card temperature

This alarm is only for unit sizes 6X. It is equivalent to Alarm 69. The report value in the alarm log indicates which power module generated the alarm:

1 = left most inverter module.

2 = middle inverter module in unit sizes 62 or 64.

2 = right inverter module in unit sizes 61 or 63.

3 = right inverter module in unit sizes 62 or 64.

5 = rectifier module.

ALARM 248, Illegal power section configuration

This alarm is only for unit sizes 6X. It is equivalent to Alarm 79. The report value in the alarm log indicates which power module generated the alarm:

1 = left most inverter module.

2 = middle inverter module in unit sizes 62 or 64.

2 = right inverter module in unit sizes 61 or 63.

3 = right inverter module in unit sizes 62 or 64.

5 = rectifier module.

ALARM 250, New spare part

The power or switch mode power supply has been exchanged. The frequency converter type code must be restored in the EEPROM. Remember to select 'Save to EEPROM' to complete.

ALARM 251, New model number

The frequency converter has a new model number.
