1 Introduction

1.1 Purpose of the Design Guide

This design guide introduces important aspects of the VLT® Advanced Harmonic Filters AHF 005/AHF 010 (referred to as AHF) for VLT® FC Series frequency converters. It describes harmonics and how to mitigate them, and it provides installation instructions and guidance on how to program the frequency converter.

The technical data and information on the connection conditions are on the nameplate and in the documentation. Always observe the recommendations and instructions in this document.

Danfoss technical documentation is also available online at *www.danfoss.com*.

1.2 Document Version

This manual is regularly reviewed and updated. All suggestions for improvement are welcome.

Table 1.1 shows the document version.

Edition	Remarks
MG80C6xx	Launch of AHF revision 03: Fan control with variable speed fan. Optimization of mechanical design. Lifting eyes in centerlines from X3 enclosure.

Table 1.1 Document Version

1.3 Intended Use

The filters are components designed for installation in electrical systems or machinery.
When installing in machines, commissioning of the filters (that is starting of operation as directed) is prohibited until it is proven that the machine complies with the Machinery Directive 2006/42/EC. Observe EN 60204.

The VLT® Advanced Harmonic Filter AHF 005/AHF 010 is intended for use with:

- VLT® HVAC Drive FC 102
- VLT® Refrigeration Drive FC 103
- VLT® AQUA Drive FC 202
- VLT® AutomationDrive FC 301/FC 302

1.4 Abbreviations, Symbols, and Conventions

1.4.1 Abbreviations

°C	Degrees Celsius
°F	Degrees Fahrenheit
A	Ampere/AMP
AC	Alternating current
AHF	Advanced Harmonic Filter
AWG	American wire gauge
CDM	Complete drive module
DC	Direct current
DPF	Displacement power factor
EMC	Electromagnetic compatibility
$f_{M,N}$	Nominal motor frequency
FC	Frequency converter
g	Ground gravity
HCS	Harmonic calculation software
$I_{M,N}$	Nominal motor current
I_{INV}	Rated inverter output current
Hz	Hertz
kHz	Kilohertz
kVAr	Kilo-volt-ampere reactive
LCP	Local control panel
m	Meter
mA	Milliampere
MCT	Motion control tool
mH	Millihenry inductance
min	Minute
ms	Millisecond
nF	Nanofarad
Nm	Newton meters
P	Active power
PCC	Point of common coupling
PDS	Power drive system
PELV	Protective extra low voltage
PF	Power factor
$P_{M,N}$	Nominal motor power
PWHD	Partial weighted harmonic distortion
Q	Reactive power
R_{SCE}	Short circuit ratio
RPM	Revolutions per minute
S	Apparent power
s	Second
TDD	Total demand distortion
THD	Total harmonic distortion
THDi	Total harmonic current distortion
THDv	Total harmonic voltage distortion

TPF	True power factor
$U_{M,N}$	Nominal motor voltage
V	Volt

Table 1.2 Abbreviations

1.4.2 Conventions

Numbered lists indicate procedures.

Bullet lists indicate other information and descriptions of illustrations.

Italicized text indicates:

- Cross-reference
- Link
- Footnote
- Parameter name
- Parameter group name
- Parameter option

All dimensions in drawings are in mm (in).

* Indicates a default setting of a parameter.

1.4.3 Safety Symbols

The following symbols are used in this guide:

⚠WARNING

Indicates a potentially hazardous situation that could result in death or serious injury.

⚠CAUTION

Indicates a potentially hazardous situation that could result in minor or moderate injury. It can also be used to alert against unsafe practices.

NOTICE

Indicates important information, including situations that can result in damage to equipment or property.

1.5 Approvals and Certifications

VLT® Advanced Harmonic Filters AHF 005/AHF 010 are designed in compliance with the directives described in this section.

More approvals and certifications are available. Contact a local Danfoss partner.

1.5.1 CE Conformity and Labeling

What is CE conformity and labeling?
The purpose of CE labeling is to avoid technical trade obstacles within EFTA and the EU. The EU has introduced the CE label as a simple way of showing whether a product complies with the relevant EU directives and standards. The CE label says nothing about the specifications or quality of the product.

1.5.2 CE Mark

CE

Illustration 1.1 CE

The CE mark (Communauté Européenne) indicates that the product manufacturer conforms to all applicable EU directives. The EU directives applicable to the design and manufacture of frequency converters are listed in *Table 1.3*.

NOTICE

The CE mark does not regulate the quality of the product. Technical specifications cannot be deduced from the CE mark.

EU Directive	Version
Low Voltage Directive	2014/35/EU
EMC Directive	2014/30/EU
Machinery Directive[1)]	2006/42/EC
ErP Directive	2009/125/EC
ATEX Directive	2014/34/EU
RoHS Directive	2011/65/EU

Table 1.3 EU Directives Applicable to Frequency Converters

1) Machinery Directive conformance is only required for frequency converters with an integrated safety function.

Declarations of conformity are available on request.

1.5.2.1 Low Voltage Directive

Drives must be CE-labeled in accordance with the Low Voltage Directive of April 20, 2016. The Low Voltage Directive applies to all electrical equipment in the 50–1000 V AC and the 75–1500 V DC voltage ranges.

The aim of the directive is to ensure personal safety and avoid property damage when operating electrical equipment that is installed, maintained, and used as intended.

1

1.5.2.2 EMC Directive

The purpose of the EMC (electromagnetic compatibility) Directive is to reduce electromagnetic interference and enhance immunity of electrical equipment and installations. The basic protection requirement of the EMC Directive is that devices that generate electromagnetic interference (EMI), or whose operation could be affected by EMI, must be designed to limit the generation of electromagnetic interference. The devices must have a suitable degree of immunity to EMI when properly installed, maintained, and used as intended.

Electrical equipment devices used alone or as part of a system must bear the CE mark. Systems do not require the CE mark, but must comply with the basic protection requirements of the EMC Directive.

1.5.2.3 Machinery Directive

The aim of the Machinery Directive is to ensure personal safety and avoid property damage to mechanical equipment used in its intended application. The Machinery Directive applies to a machine consisting of an aggregate of interconnected components or devices of which at least 1 is capable of mechanical movement.

Drives with an integrated safety function must comply with the Machinery Directive. Drives without a safety function do not fall under the Machinery Directive. If a drive is integrated into a machinery system, Danfoss can provide information on safety aspects relating to the drive.

When drives are used in machines with at least 1 moving part, the machine manufacturer must provide a declaration stating compliance with all relevant statutes and safety measures.

1.5.2.4 ErP Directive

The ErP directive is the European Ecodesign Directive for energy-related products. The directive sets ecodesign requirements for energy-related products, including frequency converters. The directive aims at increasing energy efficiency and the level of protection of the environment, while increasing the security of the energy supply. Environmental impact of energy-related products includes energy consumption throughout the entire product life cycle.

The RCM Mark label indicates compliance with the applicable technical standards for electromagnetic compatibility (EMC). An RCM Mark label is required for placing electrical and electronic devices on the market in Australia and New Zealand. The RCM Mark regulatory arrangements only deal with conducted and radiated emission. For frequency converters, the emission limits specified in EN/IEC 61800-3 apply. A declaration of conformity can be provided on request.

1.5.3 UL Compliance

Illustration 1.2 UL

NOTICE

The VLT® Advanced Harmonic Filter AHF 005/AHF 010 460 V/60 Hz and 600 V/60 Hz types are UL-listed at UL file no. E134261 (NMMS.E134261).

1.6 Safety

1.6.1 General Safety Principles

If handled improperly, drives have the potential for fatal injury as they contain high voltage components. Only qualified personnel are allowed to install and operate the equipment. Do not attempt repair work without first removing power from the drive and waiting the designated amount of time for stored electrical energy to dissipate.

Strict adherence to safety precautions and notices is mandatory for safe operation of the drive and filter.

1.6.2 Qualified Personnel

Correct and reliable transport, storage, installation, operation, and maintenance are required for the trouble-free and safe operation of the filter. Only qualified personnel are allowed to install or operate this equipment.

Qualified personnel are defined as trained staff, who are authorized to install, commission, and maintain equipment, systems, and circuits in accordance with pertinent laws and regulations. Also, the qualified personnel must be familiar with the instructions and safety measures described in this manual.

⚠WARNING

IMPROPER INSTALLATION

Improper installation of the filter or the frequency converter may cause death, serious injury, or equipment failure.

- **Follow this design guide and install according to National and Local Electrical Codes.**

⚠WARNING

HIGH VOLTAGE

Filters contain high voltage when connected to AC mains input. Failure to perform installation, start-up, and maintenance by qualified personnel can result in death or serious injury.

- **Only qualified personnel must perform installation, start-up, and maintenance.**
- **Never work on a filter in operation.**

⚠WARNING

DISCHARGE TIME

The VLT® Advanced Harmonic Filters AHF 005/AHF 010 contain capacitors. The capacitors can remain charged even when the filter is not powered. Failure to wait the specified time after power has been removed before performing service or repair work can result in death or serious injury.

1. **Stop the frequency converter and the motor.**
2. **Disconnect AC mains, permanent magnet type motors, remote DC-link supplies including battery back-ups, UPS, and DC-link connections to other frequency converters.**
3. **Wait the required time specified on the nameplate, ensuring that the capacitors are discharged fully, before performing any service or repair work on the filter.**
4. **Before performing any service or repair work on the filter, ensure that the voltage is 0 between the filter terminals X3.1, X3.2, and X3.3, and between the filter terminals X4.1, X4.2, and X4.3.**

⚠CAUTION

ELECTRICAL HAZARD

When measuring on live filters, observe the valid national regulations for the prevention of accidents (for example VBG 4).
The electrical installation must be carried out according to the appropriate regulations (for example cable cross-sections, fuses, and PE connection). When using the filters with frequency converters without safe separation from the supply line (to VDE 0100), include all control wiring in further protective measures (for example double insulated or shielded, grounded, and insulated).

⚠CAUTION

HOT SURFACE

When in use, the filter surface becomes hot.

- **Do NOT touch the filter during operation.**

⚠CAUTION

OVERTEMPERATURE

Overtemperature damages the filter chokes. To prevent overtemperature:

- **Use temperature switches, see *chapter 4.2.3 Overtemperature Protection*.**
- **Perform an immediate stop or a controlled ramp down within 30 s.**

⚠CAUTION

PROTECTIVE DEVICES

Equip systems where filters are installed with extra monitoring and protective devices according to the valid safety regulations, for example rules on technical tools and regulations for the prevention of accidents.

⚠CAUTION

Non-authorized removal of required cover, inappropriate use, incorrect installation, or operation create the risk of severe injury to persons or damage to material assets.

- **To avoid the risk, only let authorized and qualified personnel handle the VLT® Advanced Harmonic Filter AHF 005/AHF 010.**

NOTICE

The filters shown in this design guide are specially designed and tested for operation with Danfoss frequency converters, see *chapter 1.3.1 Intended Use*. Danfoss takes no responsibility for the use of the filters with third-party frequency converters.

NOTICE

REPAIR OF FILTER

Only Danfoss authorized, qualified personnel are allowed to repair the VLT® Advanced Harmonic Filter AHF 005/AHF 010. See *chapter 8 Spare Parts* for more details.

NOTICE

Commissioning is only allowed when there is compliance with the EMC Directive 2014/30/EU.
The filters meet the requirements of the Low Voltage Directive 2014/35/EU.

1

NOTICE

Protect the filter from inappropriate loads, particularly during transport and handling. Components are not allowed to be bent. Do not alter the distance in between isolation. Avoid touching electronic components and contacts.

2 Introduction to Harmonics and Mitigation

2.1 Harmonics and Mitigation

2.1.1 Linear Loads

On a sinusoidal AC supply, a purely resistive load (for example an incandescent light bulb) draws a sinusoidal current in phase with the supply voltage.

The power dissipated by the load is:
$P = U \times I$

For reactive loads (such as an induction motor), the current is no longer in phase with the voltage. Instead, the current lags the voltage creating a lagging power factor with a value less than 1. In the case of capacitive loads, the current is ahead of the voltage, creating a leading power factor with a value less than 1.

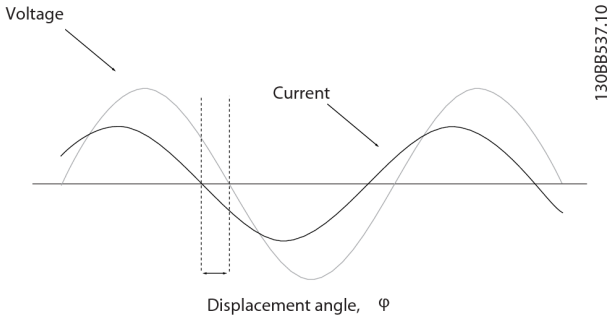

Illustration 2.1 Current Creating a True Power Factor

In this case, the AC power has 3 components:

- Real power, (P).
- Reactive power, (Q).
- Apparent power, (S).

The apparent power is:
$S = U \times I$
(where S=[kVA], P=[kW] and Q=[kVAR]).

In the case of a perfectly sinusoidal waveform, P, Q, and S can be expressed as vectors that form a triangle:
$S^2 = P^2 + Q^2$

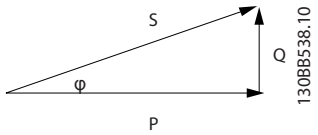

Illustration 2.2 Sinusoidal Waveform

The displacement angle between current and voltage is φ. The displacement power factor is the ratio between the active power (P) and apparent power (S):

$$DPF = \frac{P}{S} = cos(\phi)$$

2.1.2 Non-linear Loads

Non-linear loads (such as diode rectifiers) draw a non-sinusoidal current. *Illustration 2.3* shows the current drawn by a 6-pulse rectifier on a 3-phase supply.

A non-sinusoidal waveform can be decomposed in a sum of sinusoidal waveforms with periods equal to integer multiples of the fundamental waveform.

$f(t) = \sum a_h \times sin(h\omega_1 t)$

See *Illustration 2.3*.

2

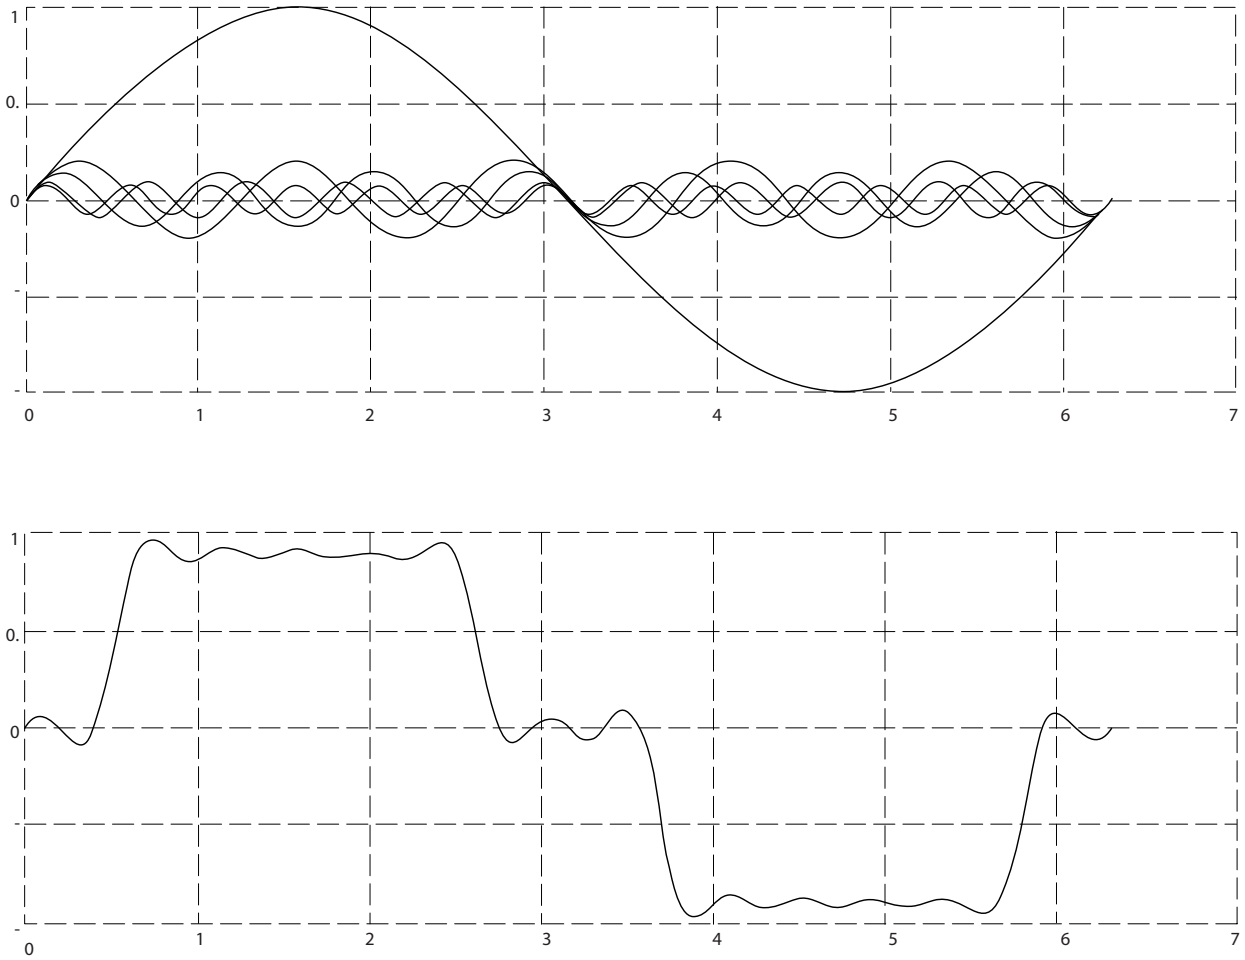

Illustration 2.3 Sinusoidal Waveforms

The integer multiples of the fundamental frequency ω1 are called harmonics. The RMS value of a non-sinusoidal waveform (current or voltage) is expressed as:

$$I_{RMS} = \sqrt{\sum_{h=1}^{h_{max}} I_{(h)}^2}$$

The number of harmonics in a waveform gives the distortion factor, or total harmonic distortion (THD). The THD is given by the ratio of RMS of the harmonic content to the RMS value of the fundamental quantity, expressed as a percentage of the fundamental:

$$THD = \sqrt{\sum_{h=2}^{h_{max}} \left(\frac{I_h}{I_1}\right)^2} \times 100\,\%$$

Using the THD, the relationship between the RMS current I_{RMS} and the fundamental current I_1 can be expressed as:

$$I_{RMS} = I_1 \times \sqrt{1 + THD^2}$$

The same applies for voltage.

The true power factor PF (λ) is:

$$PF = \frac{P}{S}$$

In a linear system, the true power factor is equal to the displacement power factor:

$$PF = DPF = cos(\phi)$$

In non-linear systems, the relationship between power factor and displacement power factor is:

$$PF = \frac{DPF}{\sqrt{1 + THD^2}}$$

Reactive power decreases the power factor and harmonic loads. A low-power factor results in a high RMS current that produces higher losses in the supply cables and transformers.

In the power quality context, the total demand distortion (TDD) term is often encountered. The TDD does not characterize the load, but it is a system parameter. TDD expresses the current harmonic distortion in percentage of the maximum demand current I_L.

$$TDD = \sqrt{\sum_{h=2}^{h_{max}} \left(\frac{I_h}{I_L}\right)^2} \times 100\,\%$$

Another term often encountered is the partial weighted harmonic distortion (PWHD). PWHD is a weighted harmonic distortion that contains only the harmonics between the 14th and the 40th, as shown in the following definition.

$$PWHD = \sqrt{\sum_{h=14}^{40} \left(\frac{I_h}{I_1}\right)^2} \times 100\,\%$$

2.1.3 The Effect of Harmonics in a Power Distribution System

In *Illustration 2.4*, a transformer is connected on the primary side to a point of common coupling, PCC1, on the medium voltage supply. The transformer has an impedance Z_{xfr} and feeds several loads. PPC 2 is the point of common coupling where all loads are connected. Each load is connected through cables that have an impedance Z_1, Z_2, Z_3.

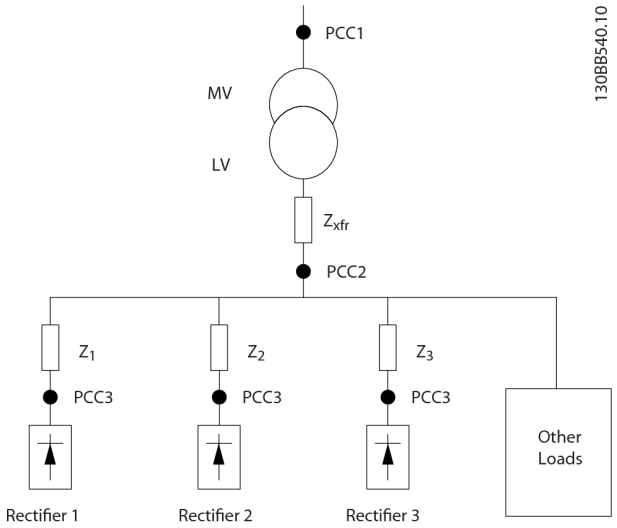

Illustration 2.4 Small Distribution System

Harmonic currents drawn by non-linear loads cause distortion of the voltage because of the voltage drop on the impedances of the distribution system. Higher impedances result in higher levels of voltage distortion.

Current distortion relates to apparatus performance, and it relates to the individual load. Voltage distortion relates to system performance. It is not possible to determine the voltage distortion in the PCC knowing only the harmonic performance of the load. To predict the distortion in the PCC, the configuration of the distribution system and relevant impedances must be known.

A commonly used term for describing the impedance of a grid is the short circuit ratio R_{sce}. This ratio is defined as the ratio between the short circuit apparent power of the supply at the PCC (S_{sc}) and the rated apparent power of the load (S_{equ}).

$$R_{sce} = \frac{S_{ce}}{S_{equ}}$$

where $S_{sc} = \frac{U^2}{Z_{supply}}$ and $S_{equ} = U \times I_{equ}$

2

The negative effect of harmonics is twofold

- Harmonic currents contribute to system losses (in cabling and transformer).
- Harmonic voltage distortion causes disturbance to and increases losses in other loads.

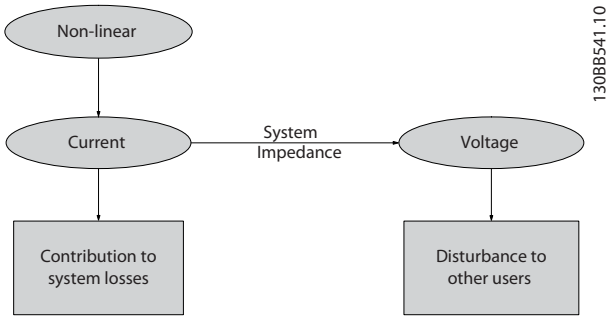

Illustration 2.5 The Negative Effect of Harmonics

2.2 Harmonic Mitigation Standards and Requirements

The requirements for harmonic limitation can be:

- Application-specific requirements.
- Requirements from standards that have to be observed.

2.2.1 Application-specific Requirements

The application-specific requirements are related to a specific installation where there are technical reasons for limiting the harmonics.

Example
Two 110 kW motors are connected to a 250 kVA transformer. One motor is connected direct online, and the other is supplied through a frequency converter. If the direct online motor should also be supplied through a frequency converter, the transformer is, in this case, undersized. To retrofit without changing the transformer, mitigate the harmonic distortion from the 2 frequency converters by using VLT® Advanced Harmonic Filters AHF 005/AHF 010.

2.2.2 Harmonic Mitigation Standards

There are various harmonic mitigation standards, regulations, and recommendations. Different standards apply in different geographical areas and industries. The following encountered standards are presented:

- IEC/EN 61000-3-2
- IEC/EN 61000-3-12
- IEC/EN 61000-3-4
- IEC 61000-2-2
- IEC 61000-2-4
- IEEE 519
- G5/4

Number of standard	Title	Scope	Comments
IEC 61000-3-2	Limits for harmonic current emissions (equipment input current ≤16 A per phase).	Equipment connected to the public low-voltage distribution system having an input current up to and including 16 A per phase.	Danfoss frequency converters are in Class A. There are no limits for professional equipment with a total rated power >1 kW.
IEC 61000-3-12	Limits for harmonic currents produced by equipment connected to public low-voltage systems with input current >16 A and ≤75 A.	Equipment connected to the public low-voltage distribution system having an input current >16 A and ≤75 A.	The emission limits are currently only for 230/400 V 50 Hz systems. There are requirements for individual harmonics (5^{th}, 7^{th}, 11^{th}, and 13^{th}) and for THD[1)] and PWHD[2)]. All frequency converters listed in *chapter 1.3 Intended Use* comply with these limits without extra filtering.
IEC 61000-3-4	Limits, limitation of emission of harmonic currents in low-voltage supply systems for equipment with rated current >16 A.	Equipment with rated current >75 A connected to the public low-voltage distribution system.	A 3-stage assessment procedure is described for the connection of equipment to the public supply. Equipment >75 A is limited to stage 3 *Connection based on the load's agreed power*. The supply authority may accept the connection of the equipment based on the agreed active power of the load's installation and local requirements of the supply authority apply. The manufacturer shall provide individual harmonics and the values for THD and PWHD.
IEC 61000-2-2/ IEC 61000-2-4	Compatibility levels for low-frequency conducted disturbances.	Stipulation of compatibility levels for low-frequency conducted disturbances in public low-voltage supply systems (IEC 61000-2-2) and industrial plants (IEC 61000-2-4).	Low-frequency disturbances include but are not limited to harmonics. Consider the values prescribed in the standards when planning installations.
IEEE 519	IEEE-recommended practices and requirements for harmonic control in electrical power systems.	Control of the voltage distortion at the PCC to a TDD of 5% and limitation of the maximum individual frequency voltage harmonic to 3%.	Establishment of goals for the design of electrical systems that include both linear and non-linear loads. Waveform distortion goals are established, and the interface between sources and loads is described as point of common coupling (PCC). The current distortion limits depend on the ratio I_{SC}/I_L where I_{SC} is the short circuit current at the utility PCC and I_L is the maximum demand load current. The limits are given for individual harmonics up to the 35^{th} and total demand distortion (TDD). The most effective way to meet the harmonic distortion requirements is to mitigate at the individual loads and measure at the PCC.
G5/4	Engineering recommendation, planning levels for harmonic voltage distortion, and the connection of non-linear equipment to transmission systems and distribution networks in the United Kingdom.	Setting planning levels for harmonic voltage distortion to be used in the process of connecting non-linear equipment. A process for establishing individual customer emission limits based on these planning levels is described.	G5/4 is a system level standard. For 400 V, the voltage THD planning level is 5% at the PCC. Limits for odd and even harmonics in 400 V systems are given in Table 2 in the standard. The standard describes a 3-stage assessment procedure for the connection of non-linear equipment. The procedure aims at balancing the level of detail required by the assessment process with the degree of risk that the connection of particular equipment results in unacceptable voltage harmonic distortion. Compliance of a system containing VLT® frequency converters depends on the specific topology and population of non-linear loads. To meet the requirements of G5/4, employ VLT® Advanced Harmonic Filters AHF 005/AHF 010.

Table 2.1 Harmonics Mitigation Standards

1) New definitions are introduced through IEC/EN 61000-3-12:2011 which means that. THD is replaced by THC/I_{ref}.
2) New definitions are introduced through IEC/EN 61000-3-12:2011 which means that PWHD is replaced by PWHC/I_{ref}

2.3 Harmonic Mitigation

There are several ways of mitigating the harmonics caused by the frequency converter 6-pulse rectifier, and they all have their advantages and disadvantages.

Selecting the right solution depends on several factors:

- The grid (background distortion, mains unbalance, resonance, and type of supply - transformer/generator).
- Application (load profile, number of loads, and load size).
- Local/national requirements/regulations (for example IEEE 519, IEC, and ER G5/4).
- Total cost of ownership (for example initial cost, efficiency, and maintenance).

IEC standards are harmonized by various countries or supra-national organizations. All above-mentioned IEC standards are harmonized in the European Union with the prefix "EN". For example, the European EN 61000-3-2 is the same as IEC 61000-3-2. The situation is similar in Australia and New Zealand, with the prefixes AS/NZS.

Categories of harmonic solutions:

- Passive
- Active

Passive solutions consist of capacitors, inductors, or a combination of the 2 in different arrangements.
The simplest solution is to add inductors/reactors of typically 3–5% in front of the frequency converter. This added inductance reduces the number of harmonic currents produced by the frequency converter. More advanced passive solutions combine capacitors and inductors in trap arrangement specially tuned to eliminate harmonics starting from, for example, the 5^{th} harmonic.

The active solutions determine the exact current that cancels the harmonics present in the circuit and synthesizes and injects that current into the system. Thus, the active solution mitigates the real-time harmonic disturbances, which makes these solutions effective at any load profile. For more details on the Danfoss active solutions, refer to *VLT® Low Harmonic Drive Operating Instructions* and *VLT® Advanced Active Filter AAF 006 Operating Instructions*.

3 Basic Operating Principle of the AHF

3.1 Operating Principle

The VLT® Advanced Harmonic Filter AHF 005/AHF 010 consists of a main inductor L_0 and a 2-stage absorption circuit with the inductors L_1 and L_2, and the capacitors C_1 and C_2. The absorption circuit is specially tuned to eliminate harmonics starting with the 5th harmonic and is specific for the designed supply frequency. Therefore, the circuit for 50 Hz has different parameters than the circuit for 60 Hz.

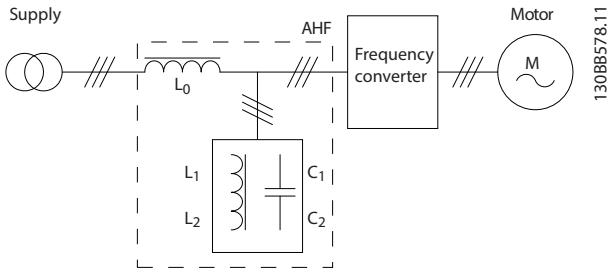

Illustration 3.1 Operating Principle

AHFs are available in 2 variants for 2 performance levels:

- AHF 005 with 5% THDi.
- AHF 010 with 10% THDi.

Each of the 2 variants is available with the following voltages:

- 380–415 V, 50 Hz.
- 380–415 V, 60 Hz.
- 440–480 V, 60 Hz.
- 600 V, 60 Hz.
- 500–690 V, 50 Hz.

The AHF 010 offers a performance similar to 12-pulse rectifiers, and the AHF 005 offers a performance similar to 18-pulse rectifiers.

The filter performance in terms of THDi varies as a function of the load. At nominal load, the filter performance is better than 10% THDi for AHF 010 and 5% THDi for AHF 005.

At part load, the THDi has higher values. However, the absolute value of the harmonic current is lower at part loads, even if the THDi has a higher value. Therefore, the negative effect of the harmonics at part loads is lower than at full load.

Example of part load

An 18.5 kW (25 hp) frequency converter is installed on a 400 V/50 Hz grid with a 34 A AHF 010 (type code AHF-DA-34-400-50-20-A).

The values in *Table 3.1* are measured for different load currents, using a harmonic analyzer:

I_{line} RMS	Basic current at 50 Hz I[1)] RMS	THDi	Total harmonic current I_h RMS
[A]	[A]	[%]	[A][1)]
9.6	9.59	5.45	0.52
15.24	15.09	13.78	2.07
20.24	20.08	12.46	2.5
25.17	25	11.56	2.89
30.27	30.1	10.5	3.15
34.2	34.03	9.95	3.39

Table 3.1 Example of Load Currents

1) The total harmonic current has been calculated. The THDi versus load plot is shown in Illustration 3.2.

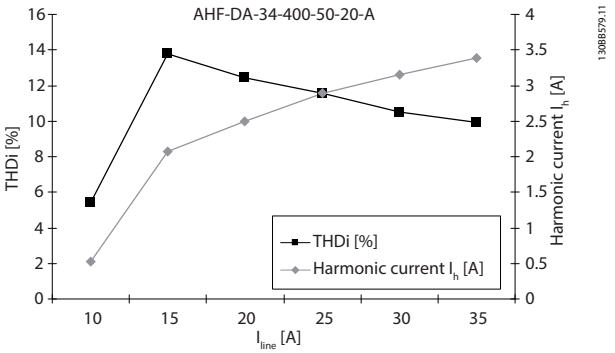

Illustration 3.2 THDi versus Load

At part load, 15 A, the THDi is approximately 14% compared to 10% at the nominal load of 34 A. At the same time, the total harmonic current is only 2.07 A at 15 A line current against 3.39 A harmonic current at 34 A line current. Thus, THDi is only a relative indicator of the harmonic performance. The harmonic distortion of the voltage is less at part load than at nominal load.

Background distortion

Factors such as background distortion and grid unbalance can affect the performance of AHF filters. The specific figures are different from filter to filter, and *Illustration 3.3* to *Illustration 3.6* show typical performance characteristics. For specific details, use a harmonic design tool such as MCT 31 or Harmonic Calculation Software (HCS).

The design of the filters aims to achieve 10%, respectively, 5% THDi levels with a background distortion of THDv = 2%. Practical measurements on typical grid conditions in

3

frequency converter installations often show that the performance of the filter is slightly better with a 2% background distortion. However, the complexity of the grid conditions and the mix of specific harmonics does not provide a general rule about the performance on a distorted grid. *Illustration 3.3* and *Illustration 3.4* show worst-case performance deterioration characteristics with the background distortion.

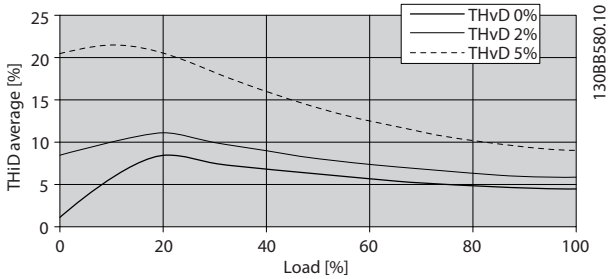

Illustration 3.3 AHF 005

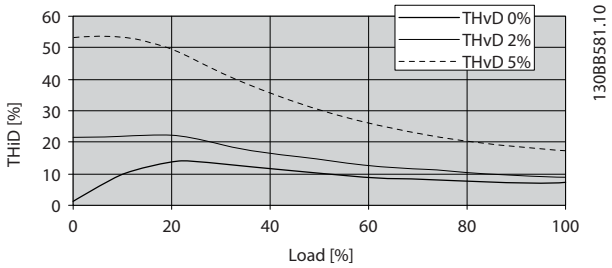

Illustration 3.4 AHF 010

Performance at 10% THDv has not been plotted. However, the filters have been tested and can operate at 10% THDv, but the filter performance can no longer be guaranteed.

The filter performance also deteriorates with the unbalance of the supply. Typical performance is shown in *Illustration 3.5* and *Illustration 3.6*.

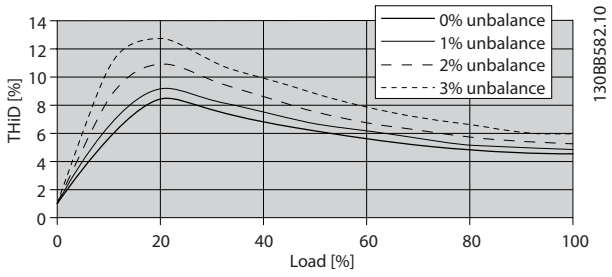

Illustration 3.5 AHF 005

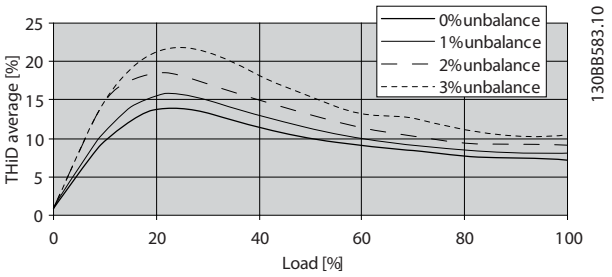

Illustration 3.6 AHF 010

3.1.1 Power Factor

In no-load conditions (the frequency converter is in standby), the frequency converter current is negligible, and the main current drawn from the grid is the current through the capacitors in the harmonic filter. Therefore, the power factor is close to 0, capacitive. The capacitive current is approximately 25% of the filter nominal current (depends on filter size, typical values of 20–25%). The power factor increases with the load. Because of the higher value of the main inductor L_0 in the VLT® Advanced Harmonic Filter AHF 005, the power factor is slightly higher than in the VLT® Advanced Harmonic Filter AHF 010.

Illustration 3.7 and *Illustration 3.8* show typical values for the true power factor on AHF 010 and AHF 005.

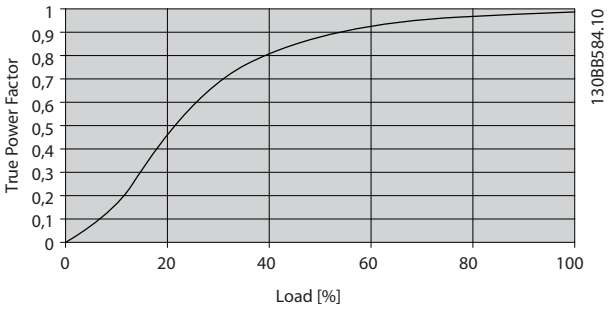

Illustration 3.7 AHF 005

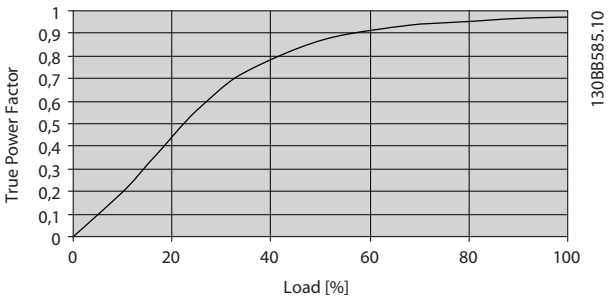

Illustration 3.8 AHF 010

3.1.2 Capacitive Currents

If the specific application requires a higher power factor at no-load and a reduction of the capacitive current in standby, use a capacitor disconnect. A contactor disconnects the capacitor at loads below 20%.

NOTICE

It is important to note that the capacitors must not be connected at full load or disconnected at no load.

It is important to consider the capacitive current in the design of applications where the harmonic filter is supplied by a generator. The capacitive current can cause overvoltage of the generator in no-load and low-load conditions. The overvoltage causes an increase of the voltage, which then may exceed the allowed voltage for the filter and the frequency converter. Therefore, always use a capacitor disconnect in generator applications and consider the design carefully. For more information about capacitive currents, refer to *chapter 4.2.1.1 Terminals for Capacitor Disconnect*.

Compared to multi-pulse rectifiers, passive harmonic filters (such as VLT® Advanced Harmonic Filter AHF 005/AHF 010) are more robust against background distortion and supply imbalance. However, the performance of passive filters is inferior to the performance of active filters when it comes to part load performance and power factor. For details about the performance positioning of the various harmonic mitigation solutions offered by Danfoss, consult the relevant harmonic mitigation manuals.

3.2 Energy Efficiency

For energy efficiency calculations see *chapter 9.1 Energy Efficiency*.

4 Requirements for Installation

4.1 Mechanical Mounting

4.1.1 Safety Requirements of Mechanical Installation

⚠WARNING

HEAVY LOAD!

Unbalanced loads can fall and loads can tip over. Failure to take proper lifting precautions increases risk of death, serious injury, or equipment damage.

- **Never walk under suspended loads.**
- **Wear personal protective equipment.**
- **Observe the weight of the unit and ensure that proper lifting equipment is used.**
- **The center of gravity can be in an unexpected area. If that is not observed, the unit can fall over or tilt unexpectedly during lifting and transport. Check the center of gravity, before lifting the load.**
- **When installing the filter, use the lifting eyes on both sides to lift the filter.**

Lift the filters using the dedicated lifting eyes. For enclosure X3-V3 to X8-V3 extra lifting eyes are placed in the centerline.

⚠CAUTION

For filters with external fan, place hooks in the lifting eyes to lift the unit. Do not attempt to use lifting bars or other methods with equipment going through the lifting eyes, since this could harm the fan.

⚠CAUTION

Do not lift the unit with the IP 21/NEMA 1 kit top cover mounted. This could damage the top cover or compromise the safety during lifting.

Illustration 4.1 and *Illustration 4.2* show the recommended lifting methods for the different AHF types.

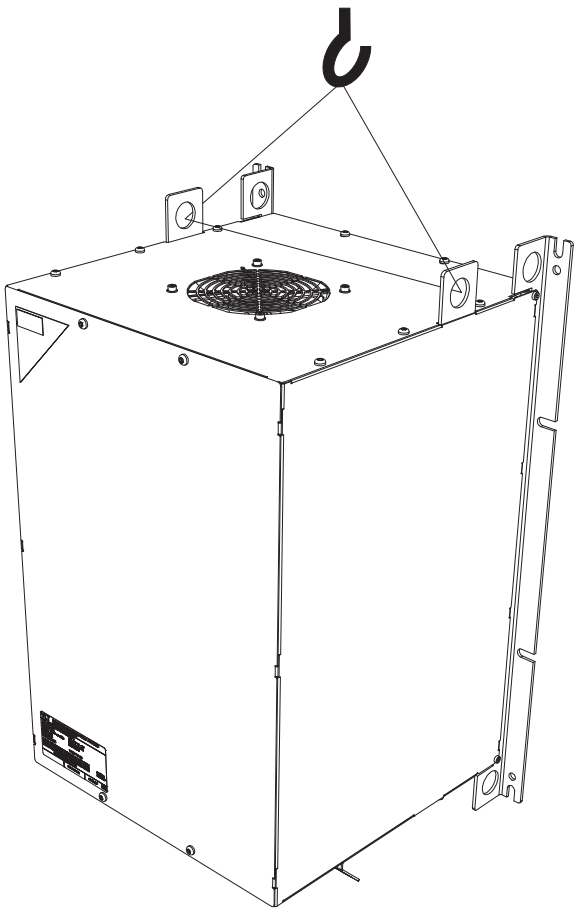

Illustration 4.1 Lifting Method, Internal Fan Filters

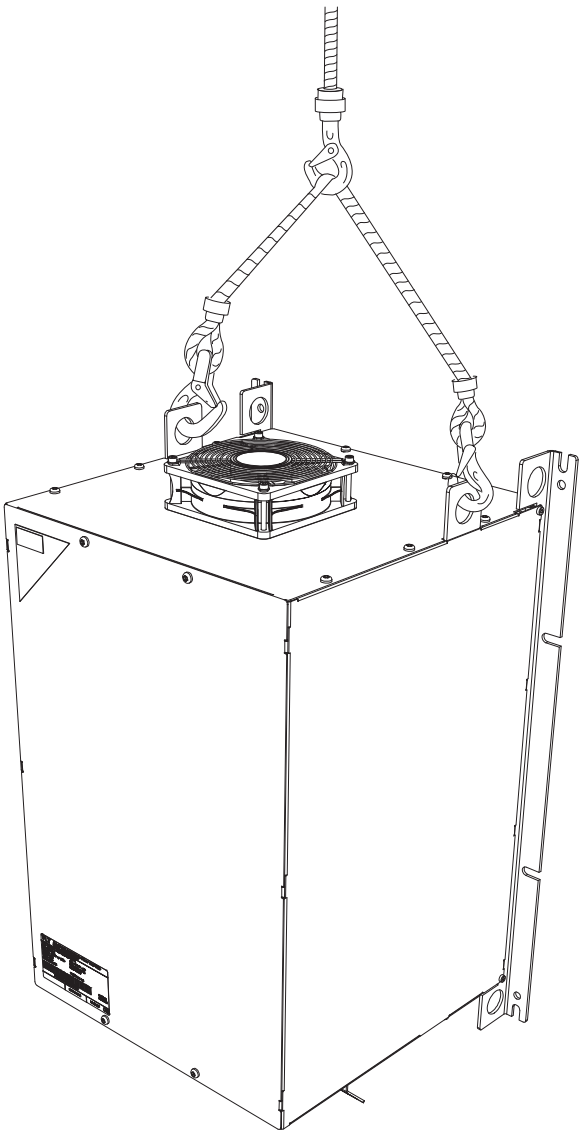

Illustration 4.2 Recommended Lifting Method, External Fan Filters

4.1.2 Mounting Requirements

The filters are available as IP20 with optional IP21/NEMA 1 upgrade kit. During installation, follow the described recommendations for the protection rating.

- Mount all filters vertically with the terminals at the bottom.
- Pay attention to the specified mounting holes and other relevant information on the mechanical drawings in *chapter 7.4.2 IP20 Enclosures*.
- Do not mount the filter close to other heating elements or heat-sensitive material (such as wood).
- Top and bottom clearances are minimum 150 mm (5.91 in).
- The surface temperature of the IP20 filters does not exceed 70 °C (158 °F).
- The filter can be mounted side by side with the frequency converter, and there is no spacing requirement between them.
- These requirements also apply for the IP20 units when upgraded with the optional IP21/NEMA 1 upgrade kit.

4.1.3 Recommendations for Installation in Industrial Enclosures

To avoid high frequency noise coupling, keep a minimum distance of 150 mm (5.91 in) to:

- Mains supply wires.
- Motor wires of frequency converter.
- Control wires and signal wires (voltage range <48 V).

To obtain low impedance HF connections, grounding, shielding, and other metallic connections (for example mounting plates and mounted units) should have a surface as large as possible to metallic ground. Use grounding and potential equalization wires with a cross-section as wide as possible (minimum 10 mm^2 (8 AWG)) or thick grounding tapes. Use copper or tinned copper shielded wires only, as steel shielded wires are not suitable for high frequency applications. Connect the shield with metal clamps or metal glands to the equalization bars or PE connections.

Always equip inductive switching units such as relay and magnetic contactor with varistors, RC circuits, or suppressor diodes.

4.1.4 Ventilation and Cooling Requirements

The compact design of the filters is based on forced cooling, and the filters are cooled by circulating air. Therefore, ensure that air can circulate freely above and below the filter, by observing the minimum clearance requirements. The filters are cooled via built-in variable speed fans, and they have ventilation channels in the enclosure. The fans and ventilation channels provide the required airflow to prevent the filters from overheating.

When mounting the filters in panels or other industrial enclosures, ensure that there is a sufficient airflow through the panel to reduce the risk of overheating the filter and the surrounding components.

If other heat sources (such as frequency converters) are installed in the same enclosure, also consider the heat they generate when dimensioning the cooling of the enclosure.

4.1.4.1 Requirements for IP20 and IP21/ NEMA 1

To guide air through the gap between the wall and the filter, mount the filters on a wall. In installations, for example panels, where the filter is mounted on rails, the filter is not sufficiently cooled because of false airflow. To overcome the false airflow, order a backplate (thickness: 2 mm (0.08 in)), shown in *Illustration 4.4*. See *Table 5.12* for order number.

For information about the backplate dimensions, see *chapter 7.4.4 Backplate Dimensions*.

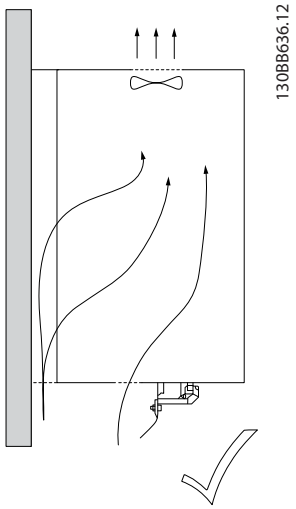

Illustration 4.3 Correct Airflow without Backplate

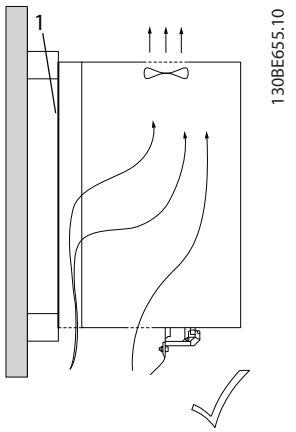
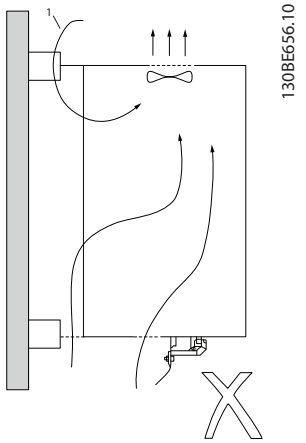


1	Backplate - 2 mm (0.08 in) thickness

Illustration 4.4 Correct Airflow with Backplate



1	False airflow

Illustration 4.5 False Airflow

4

Fan concept

The VLT® Advanced Harmonic Filters AHF 005/AHF 010 use variable speed fans for cooling. The fans are supplied from mains supply and are mounted as either internal or external built-in fans. The external fans have larger dimensions. See *chapter 7.4 Mechanical Dimensions*.

There are 2 different fan types, see *Illustration 4.6* and *Illustration 4.7*:

- Internal fan: Standard fan mounted inside the filter enclosure.
- External fan: Standard fan mounted outside the filter enclosure.

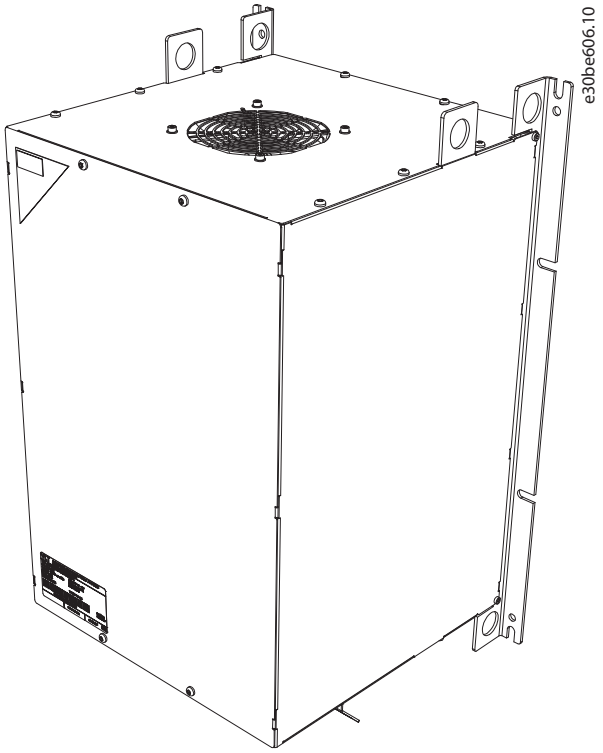


Illustration 4.6 Fan Concept, Internal Fan

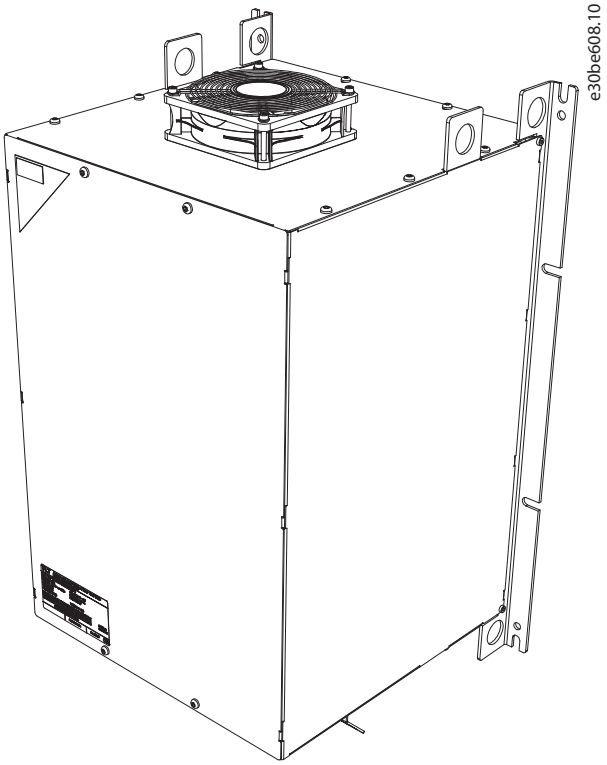

Illustration 4.7 Fan Concept, External Fan

NOTICE

IP21/NEMA 1 UPGRADE KIT

An IP21/NEMA 1 upgrade kit is available for the VLT® Advanced Harmonic Filter AHF 005/AHF 010. See *chapter 5.3.1 IP21/NEMA 1 Upgrade Kit* for further details.

4.2 Electrical Installation

4.2.1 Terminals - Short Overview

The VLT® Advanced Harmonic Filter AHF 005/AHF 010 contains the following terminals:

- X1.1–X1.3 are the mains terminals.
- X2.1–X2.3 are the output terminals to the frequency converter.
- X3.1–X4.3 are optional connection terminals for capacitor disconnect.
- A and B are the temperature switch connected to the frequency converter.
- PE for protective earth.

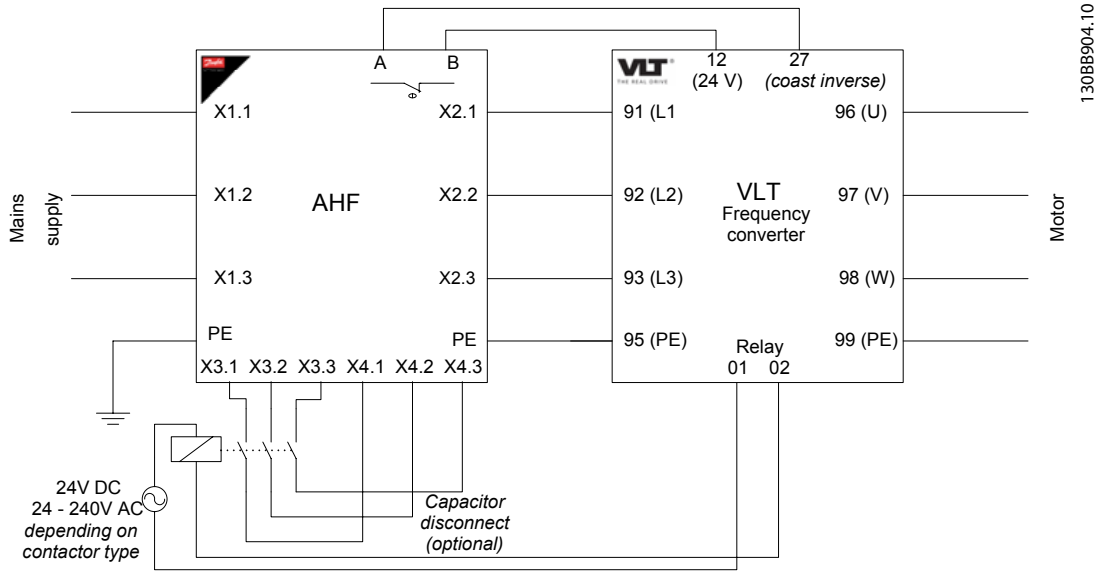

Illustration 4.8 Connection Diagram

4.2.1.1 Terminals for Capacitor Disconnect

From the factory, the terminals for the capacitor disconnect are bypassed or looped with jumpers. When using an external contactor, remove the jumper and use a relay. Refer to *chapter 5.2.1 Capacitor Disconnect Contactors*, *chapter 5.3.1.2 IP21/NEMA 1 Upgrade Kit with Built-in Capacitor Disconnect Circuitry*, and *Illustration 5.2* for more details.

NOTICE

A Danfoss frequency converter can be used for controlling the relay of an external contactor. See *chapter 6 Programming* for more information.

NOTICE

The capacitor disconnect feature does not apply to VLT® AutomationDrive FC 301.

The power factor of the VLT® Advanced Harmonic Filter AHF 005/AHF 010 decreases with decreasing load. At no load, the power factor is 0, and the capacitors produce leading current of approximately 25% of the rated filter current. In applications where this reactive current is not acceptable, disconnect the capacitor bank via terminals X3.1, X3.2, X3.3, and X4.1, X4, X4.3.

Per default (on delivery) the wiring shortens terminal X3.1 with X4.1, X3.2 with X4.2, and X3.3 with X.4.3. If no capacitor disconnect is required, do not change these shortened terminals.

If a disconnection of the capacitors is required, place a 3-phase contactor between terminals X3 and X4. Using AC3 contactors is recommended, see *chapter 5.2.1 Capacitor Disconnect Contactors*. An IP21/NEMA 1 upgrade kit with built-in capacitor disconnect circuitry is available as an option, see *chapter 5.3.1 IP21/NEMA 1 Upgrade Kit*.

Paralleling AHF

It is possible to run 2 filters in parallel and still use both the capacitor disconnect and the temperature switch. Wire according to *Illustration 4.9*.

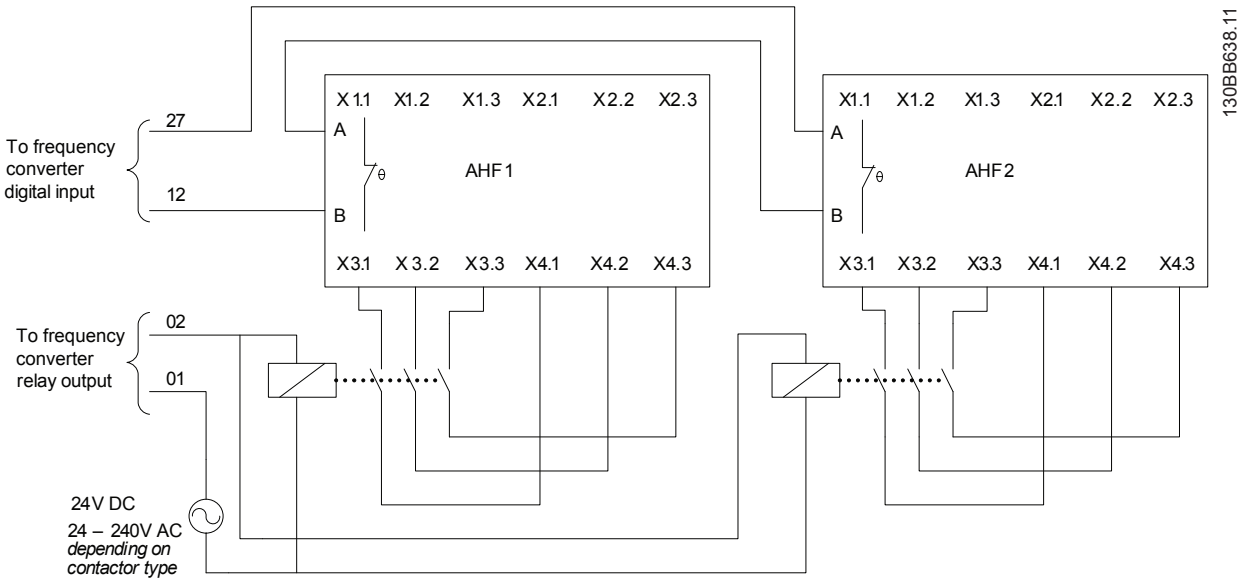

Illustration 4.9 Parallel Use of AHF Combined with Capacitor Disconnect

NOTICE

It is not allowed to use 1 common 3-poled contactor with paralleled filters.

NOTICE

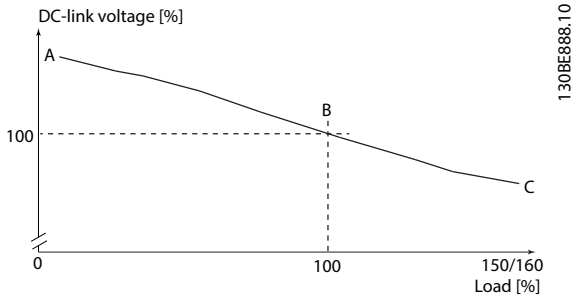
Keep the cable length between the filter and the capacitor disconnect contactor as short as possible to reduce the impedance influence on the cable. A maximum cable length of 2 m (6.6 ft) is allowed between filter and contactor.

Voltage boost

The AHF is designed to ensure the lowest possible insertion loss to provide full DC-link voltage in the frequency converter. The target of this design is to ensure full DC-link voltage at nominal load, see B in *Illustration 4.10*. Providing the full DC-link voltage at nominal load results in a minor voltage boost at low-load conditions and a minor voltage drop at overload conditions. The voltage boost at low load (A in *Illustration 4.10*) is approximately 5%, while the voltage drop at overload (C in *Illustration 4.10*) is a few percentages. *Illustration 4.10* shows the insertion loss in the frequency converter as a function of load.

NOTICE

The voltage boost causes the voltage at the frequency converter terminals to be up to 5% higher than the voltage at the input of the filter when the capacitors are not disconnected. Consider this situation when designing the installation. Take special care in 690 V applications where the voltage tolerance of the frequency converter is reduced to +5%, unless a capacitor disconnect is used.



A	Low-load condition or standby. Approximately 5% voltage boost occurs without the capacitors being disconnected. If the capacitors are disconnected, the voltage boost can be reduced.
B	Nominal load condition. The AHF is optimized for full DC-link voltage in the frequency converter at nominal load conditions.
C	Overload condition. A voltage drop of a few percentages occurs at high overload conditions.

Illustration 4.10 Insertion Loss in the Frequency Converter as a Function of Load

NOTICE

Only switch the contactor at less than 20% output power. Allow minimum 25 s for the capacitors to discharge before reconnecting. See more details in *chapter 6 Programming*.

NOTICE

Do not use the capacitor disconnect feature if several frequency converters are connected to the same filter.

4.2.2 Wiring

When wiring, also refer to *Illustration 4.8*.

1. Connect supply voltage to terminals X1.1, X1.2, and X1.3.
2. Connect the frequency converter supply terminals L1, L2, and L3 to the filter terminals X2.1, X2.2, and X2.3.

Wiring recommendations for paralleling of frequency converters

If connecting several frequency converters to 1 harmonic filter, the connection method is similar to the connection described above. Connect the supply terminals L1, L2, and L3 of the frequency converters to the filter terminals X2.1, X2.2, and X2.3.

NOTICE

Use cables complying with local regulations.

Wiring recommendations for paralleling of filters

If the mains input current of the frequency converter exceeds the nominal current of the largest harmonic filter, several harmonic filters can be paralleled to achieve the necessary current rating, see *chapter 7.1 General Specifications*.

1. Connect supply voltage to terminals X1.1, X1.2, and X1.3 of the filters.
2. Connect the frequency converter supply terminals L1, L2, and L3 to the filters terminals X2.1, X2.2, and X2.3.

4.2.3 Overtemperature Protection

The VLT® Advanced Harmonic Filters AHF 005/AHF 010 are all equipped with a galvanically isolated switch (PELV). The switch is closed under normal operating conditions. If the filter is overheated, the switch opens.

Each filter contains 3 thermal switches mounted in series in each inductor group. At temperatures above 140 °C (284 °F), the switches open.

NOTICE

It is mandatory to use the integrated temperature switch to prevent damage of the filter caused by overtemperature. To prevent filter damage, perform an immediate stop or a controlled ramp down within maximum 30 s.

NOTICE

POSSIBLE INSUFFICIENT AIRFLOW

If the switch activates repeatedly, it is probably caused by insufficient airflow through the filter.

- **Evaluate the airflow and the installation conditions.**
- **Check if the fan inlet or outlet is blocked.**
- **Check for defective fan.**
- **Check for defective fan control.**

4.2.3.1 Programming of Digital Inputs for Overtemperature Protection

The following describes the most commonly used programming examples. For more details, refer to *chapter 6 Programming*.

Example 1

1. Connect terminal A of the harmonic filter to terminal 12 or 13 (voltage supply digital input, 24 V) of the frequency converter.
2. Connect terminal B to terminal 27.
3. Program the digital input terminal 27 to *Coast Inverse*.

If an overtemperature is detected, the frequency converter coasts the motor and thus unloads the filter.

Example 2

1. Connect terminal A of the harmonic filter to terminal 12 or 13 (voltage supply digital input, 24 V DC) of the frequency converter.
2. Connect terminal B to terminal 33.
3. Set *parameter 1-90 Motor Thermal Protection*.
4. Set *parameter 1-93 Thermistor Resource*.

NOTICE

The maximum rating of the temperature switch is 250 V AC and 2 A.

5 Selection of Advanced Harmonic Filter

This chapter helps selecting the right filter size and contains calculation examples, electrical data, and order number for the filters.

5.1 Selecting the Correct AHF

For optimal performance, size the VLT® Advanced Harmonic Filter AHF 005/AHF 010 for the mains input current to the frequency converter. This current is the input current drawn based on the expected load of the frequency converter and not on the size of the frequency converter itself.

5.1.1 How to Calculate the Correct Filter Size

Calculate the mains input current of the frequency converter ($I_{FC,L}$). Use the nominal motor current ($I_{M,N}$) and the displacement factor (Cos φ) of the motor for the calculation. Both values are normally printed on the nameplate of the motor. If the nominal motor voltage ($U_{M,N}$) is unequal to the actual mains voltage (U_L), correct the calculated current with the ratio between these voltages, see the following formula:

$$I_{FC.L} = 1.1 \times I_{M,N} \times cos(\varphi) \times \frac{U_{M,N}}{U_L}$$

The selected VLT® Advanced Harmonic Filter AHF 005/AHF 010 must have a nominal current ($I_{AHF,N}$) ≥ the calculated frequency converter mains input current ($I_{FC,L}$).

NOTICE

Do not oversize the AHF. The best harmonic performance is obtained at nominal filter load. Using an oversized filter most likely results in reduced THDi performance.

If connecting several frequency converters to the same filter, size the AHF according to the sum of the calculated mains input currents.

NOTICE

If the AHF is sized for a specific load, and the motor is changed, recalculate the current to avoid overloading the AHF.

5.1.2 Calculation Example

System mains voltage (U_L):	380 V
Motor nameplate power (P_M):	55 kW (75 hp)
Motor efficiency (η_M):	0.96
Frequency converter efficiency (η_{FC}):	0.97
AHF efficiency (η_{AHF})(worst-case estimate):	0.98

Table 5.1 Data for Calculation of Filter Size

Maximum line current (RMS):

$$\frac{P_M \times 1000}{U_L \times \eta_M \times \eta_{FC} \times \eta_{AHF} \times \sqrt{3}} = \frac{55 \times 1000}{380 \times 0.96 \times 0.97 \times 0.98 \times \sqrt{3}} = 91.57\ A$$

In this case, select a 96 A filter.

5.1.3 Voltage Boost

NOTICE

VOLTAGE BOOST

The voltage boost causes the voltage at the frequency converter terminals to be up to 5% higher than the voltage at the input of the filter when the capacitors are not disconnected. Consider this situation when designing the installation. Take special care in 690 V applications where the voltage tolerance of the frequency converter is reduced to +5%, unless a capacitor disconnect is used. For more information, see *chapter 4.2.1.1 Terminals for Capacitor Disconnect* and *Illustration 4.10*.

5.2 Selection Tables

Table 5.2 explains in detail the terminology used in *Table 5.3* to *Table 5.8*.

Value	Description
Power rating	The frequency converter kW power rating. The power rating is not necessarily the type code power rating, but the actual operating power rating. Changing operating conditions between HO and NO changes the frequency converter operating conditions. The selection of the VLT® Advanced Harmonic Filter AHF 005/AHF 010 must reflect the actual operating conditions of the frequency converter.
Input current	The maximum input current ratings of the frequency converter in the specific mains supply voltage range.
Current rating	Filter current rating at nominal load. Current ratings are combined values when paralleling filters.
AHF 005	AHF version with a performance level of 5% THDi or better at system level with nominal load.
AHF 010	AHF version with a performance level of 10% THDi or better at system level with nominal load.
Order numbers	AHF order number. The selected AHF must match the actual mains type.
Enclosure size, enclosure protection ratings, and fan concept: • [Enclosure size] IP20-V3 if • [Enclosure size] IP20-V3 ef	Confirming the fan concepts and reference to mechanical drawings as: • [Enclosure size] IP20 AHF version 3 with internal fan with variable speed. • [Enclosure size] IP20 AHF version 3 with external fan with variable speed.
IP20	Enclosure protection degree IP20. IP21/NEMA 1 upgrade kits are available for all IP20 filters as separate options.

Table 5.5 Frequency Converters with Voltage Classes T4 and T5, Operating at 440–480 V, 60 Hz

1) The power ratings in selection table are the actual operating power and not necessarily the type code power rating.

Changing operating conditions between HO and NO changes the actual operating conditions and the filter selection must reflect actual operating conditions.

2) Typical hp shaft output at 460 V.

3) Filters are used as paralleling for 500 kW and 710 kW.

Table 5.8 Selection Table, Capacitor Disconnect Contactors - Danfoss Types

5.2.1.1 Non-Danfoss Contactors

Non-Danfoss contactors are compatible with the VLT® Advanced Harmonic Filter AHF 005/AHF 010. If using non-Danfoss contactors for capacitor disconnect, always select AC3-types. The current rating of the contactor must be equal to or higher than 50% of the nominal current rating of the AHF.

If the contactor is controlled by external equipment and not by a specific parameter in a Danfoss frequency converter, use contactors for capacitive switching.

5.3 Accessories

5.3.1 IP21/NEMA 1 Upgrade Kit

An upgrade kit is available for upgrading the VLT® Advanced Harmonic Filter AHF 005/AHF 010 from IP20 to IP21/NEMA 1.

The kit consists of 2 parts:

- A top plate that prevents dirt and vertically falling drops of water from entering the filter.
- A terminal box enclosing the terminals and connections, thus ensuring touch-safe terminals.

5

Illustration 5.1 shows the upgrade kit mounted on a filter with external fan. However, the kit is used for filters with both internal and external fan, and does not vary according to fan type.

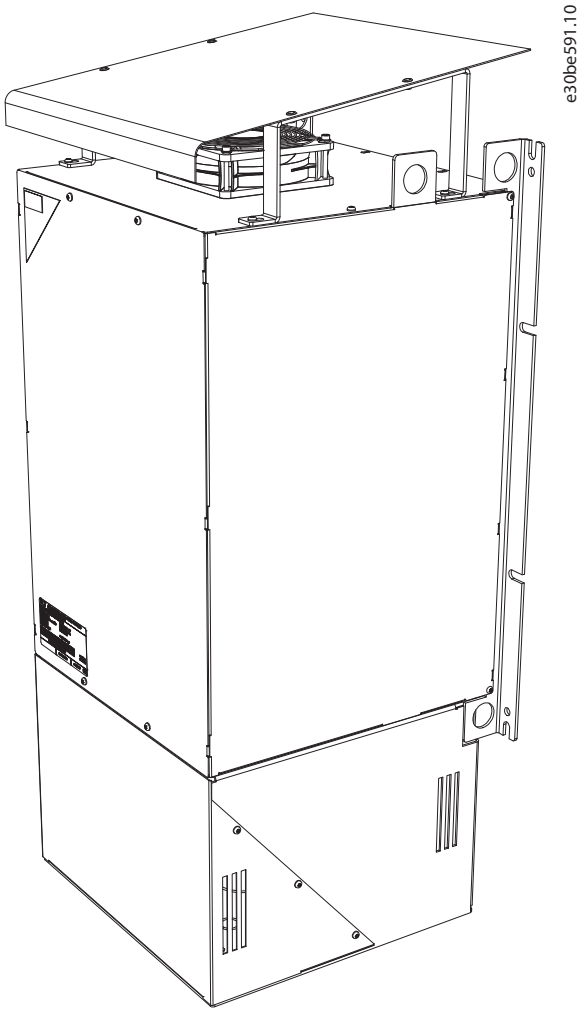

Illustration 5.1 IP21/NEMA 1 Kit, Internal Fan and External Fan

Furthermore, the kit is available in 2 versions:

- Without built-in capacitor disconnect circuitry.
- With built-in capacitor disconnect circuitry.

For further information on capacitor disconnect circuitry, refer to *chapter 4.2.1.1 Terminals for Capacitor Disconnect*.

5.3.1.1 IP21/NEMA 1 Upgrade Kit without Built-in Capacitor Disconnect Circuitry

The upgrade kits are supporting the VLT® Advanced Harmonic Filters family types AHF 005/AHF 010, IP20 revision 03.

NOTICE

The IP21/NEMA 1 upgrade kits can only be used in combination with AHF revision 3. Contact Danfoss for IP21/NEMA 1 upgrade kits for AHF revision 1 or 2, or order according to the MG80C502 selection tables.
Refer to *chapter 8 Spare Parts* for more information on identification of revision number.

Valid only for AHF revision 03

5.3.1.2 IP21/NEMA 1 Upgrade Kit with Built-in Capacitor Disconnect Circuitry

NOTICE

The IP21/NEMA 1 upgrade kits can only be used in combination with AHF revision 3. Contact Danfoss for IP21/NEMA 1 upgrade kits for AHF revision 1 or 2, or order according to the MG80C502 selection tables.
Refer to *chapter 8 Spare Parts* for more information on identification of revision number.

Valid only for AHF revision 03

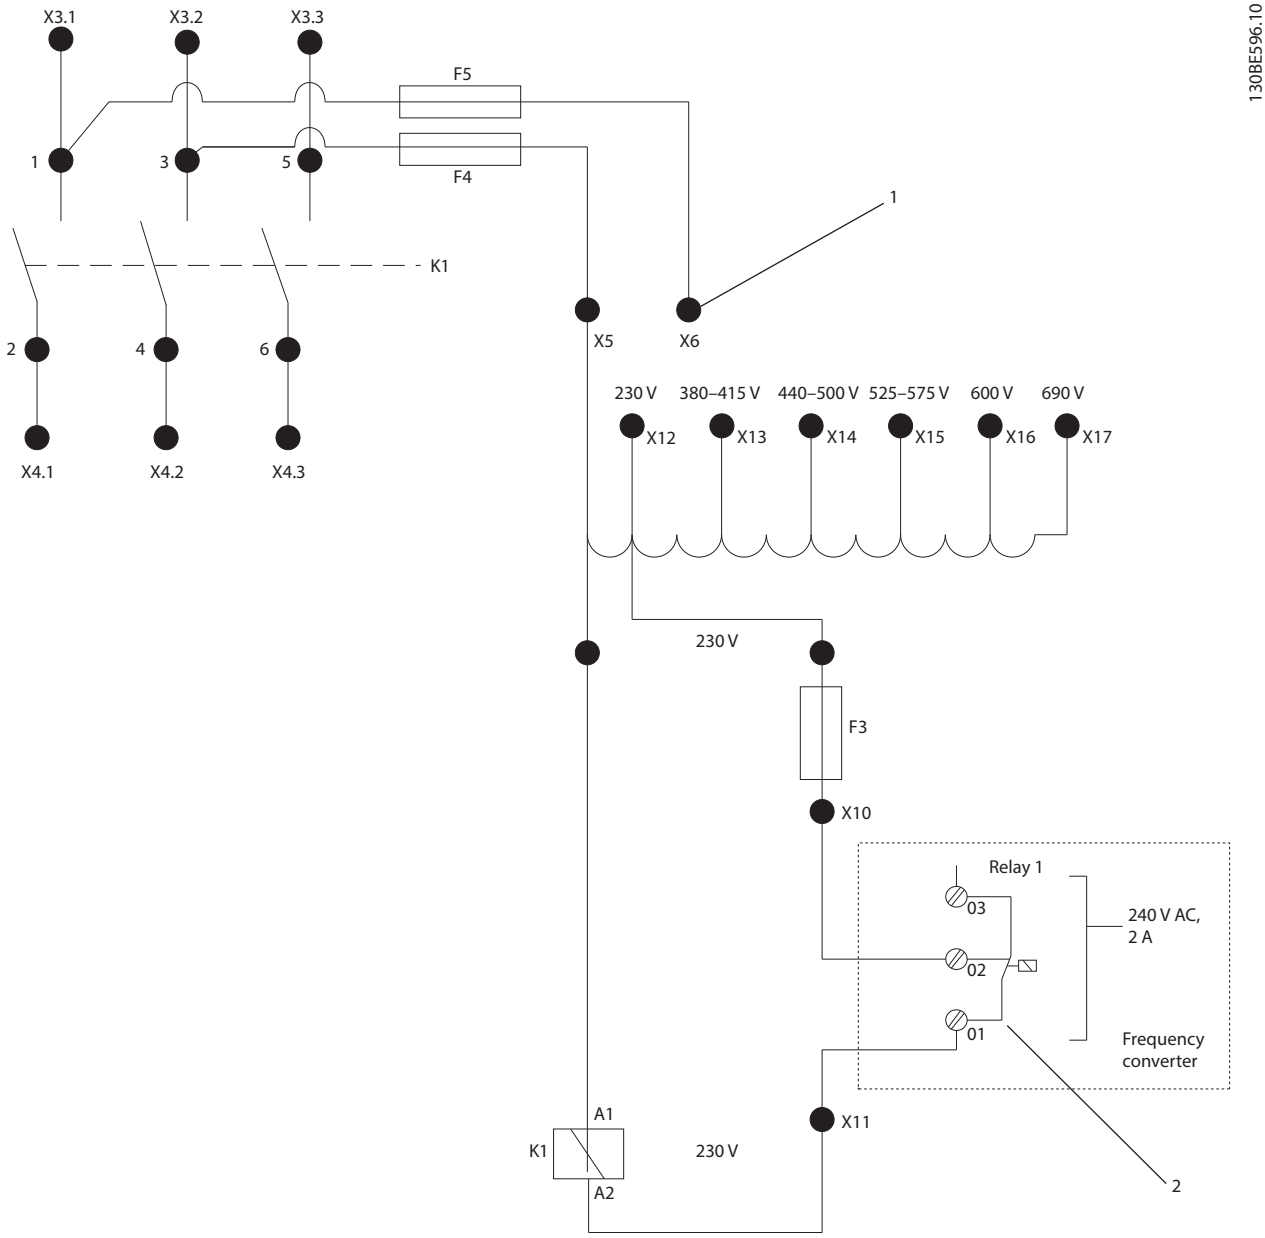
Table 5.10 Selection Table, Upgrade Kit with Built-in Capacitor Disconnect Circuitry



1	The jumper connection wire is delivered looped at terminal X6 from the factory. Refer to *Table 5.11* for selecting the correct terminal for jumper connection.
2	Relay on the control card of the frequency converter.

Illustration 5.2 Control Voltage Setting

For more details on wiring of capacitor disconnect, refer to *chapter 4.2.1.1 Terminals for Capacitor Disconnect*.

AHF filter type	Terminals
Mains voltage AHF	Wire connections to transformer
230 V	X6–X12
380–415 V	X6–X13
440–480 V	X6–X14
500 V	X6–X14
525–575 V	X6–X15
600 V	X6–X16
690 V	X6–X17

Table 5.11 Control Voltage Setting, IP21/NEMA1 Kit with Contactor

5

5.3.2 Backplate for IP20 and IP21

To avoid false airflow when mounting the filter on rails, order a backplate. For more information, see *chapter 7.4.4 Backplate Dimensions*.

The backplates are valid for filters revision 1, 2, and 3.

Ordering number	Backplate
130B3283	X1
130B3284	X2
130B3285	X3
130B3286	X4
130B3287	X5 and X6
130B3288	X7 and X8

Table 5.12 Selection Table, Backplate

6 Programming

6.1 Parameter Descriptions

The parameters in this section are limited to the parameters required for operating the VLT® Advanced Harmonic Filter AHF 005/AHF 010. For reference to other parameters, refer to the frequency converter programming guide.

5-00 Digital I/O Mode		
Digital inputs and programmed digital outputs are pre-programmable for operation either in PNP or NPN systems.		
Option:		**Function:**
		NOTICE **Perform a power cycle to activate the parameter once it has been changed.**
[0] *	PNP	Action on positive directional pulses (↕). PNP systems are pulled down to GND.
[1]	NPN	Action on negative directional pulses (↕). NPN systems are pulled up to +24 V, internally in the frequency converter.

5-01 Terminal 27 Mode		
Option:		**Function:**
		NOTICE **This parameter cannot be adjusted while the motor is running.**
[0] *	Input	Defines terminal 27 as a digital input.
[1]	Output	Defines terminal 27 as a digital output.

5-02 Terminal 29 Mode		
Option:		**Function:**
		NOTICE **This parameter is available for FC 302 only.**
[0] *	Input	Defines terminal 29 as a digital input.
[1]	Output	Defines terminal 29 as a digital output.

6.1.1 5-1* Digital Inputs

The digital inputs are used for selecting various functions in the frequency converter. *Table 6.2* shows which functions can be assigned to digital inputs.

Functions in group 1 have higher priority than functions in group 2.

Group 1	Reset, coast stop, reset, and coast stop, quick stop, DC brake, stop, and the [Off] key.
Group 2	Start, latched start, reversing, start reversing, jog, and freeze output.

Table 6.1 Function Groups

Digital input function	Select	Terminal
No operation	[0]	All, terminal 32, 33
Reset	[1]	All
Coast inverse	[2]	All, terminal 27
Coast and reset inverse	[3]	All
Quick stop inverse	[4]	All
DC brake inverse	[5]	All
Stop inverse	[6]	All
Start	[8]	All, terminal 18
Latched start	[9]	All
Reversing	[10]	All, terminal 19
Start reversing	[11]	All
Enable start forward	[12]	All
Enable start reverse	[13]	All
Jog	[14]	All, terminal 29
Preset reference on	[15]	All
Preset ref bit 0	[16]	All
Preset ref bit 1	[17]	All
Preset ref bit 2	[18]	All
Freeze reference	[19]	All
Freeze output	[20]	All
Speed up	[21]	All
Speed down	[22]	All
Set-up select bit 0	[23]	All
Set-up select bit 1	[24]	All
Precise stop inverse	[26]	18, 19
Precise start, stop	[27]	18, 19
Catch up	[28]	All
Slow down	[29]	All
Counter input	[30]	29, 33
Pulse input edge triggered	[31]	29, 33
Pulse input time based	[32]	29, 33
Ramp bit 0	[34]	All
Ramp bit 1	[35]	All

Digital input function	Select	Terminal
Latched precise start	[40]	18, 19
Latched precise stop inverse	[41]	18, 19
External interlock	[51]	–
DigiPot increase	[55]	All
DigiPot decrease	[56]	All
DigiPot clear	[57]	All
DigiPot hoist	[58]	All
Counter A (up)	[60]	29, 33
Counter A (down)	[61]	29, 33
Reset Counter A	[62]	All
Counter B (up)	[63]	29, 33
Counter B (down)	[64]	29, 33
Reset counter B	[65]	All
Mech. brake feedb.	[70]	All
Mech. brake feedb. inv.	[71]	All
PID error inv.	[72]	All
PID reset I-part	[73]	All
PID enable	[74]	All
MCO specific	[75]	All
PTC card 1	[80]	All
PROFIdrive OFF2	[91]	All
PROFIdrive OFF3	[92]	All
Light load detection	[94]	All
Evacuation	[95]	All
Mains Loss	[96]	32, 33
Mains loss inverse	[97]	32, 33
Start edge triggered	[98]	All
Safety option reset	[100]	–
Enable master offset	[108]	All
Start virtual master	[109]	All
Start homing	[110]	All
Activate touch	[111]	All
Relative position	[112]	All
Enable reference	[113]	All
Sync. to Pos. Mode	[114]	All
Home sensor	[115]	18, 32, 33
Home sensor inverse	[116]	18, 32, 33
Touch sensor	[117]	18, 32, 33
Touch sensor inverse	[118]	18, 32, 33
Speed mode	[119]	All
Power Limit Mot.	[231]	All
Power Limit Gen.	[232]	All
Power Limit Both	[233]	All
Light Load + Evacuation	[234]	All

Table 6.2 Digital Input Function

VLT® AutomationDrive FC 301/FC 302 standard terminals are 18, 19, 27, 29, 32, and 33. VLT® General Purpose I/O MCB 101 terminals are X30/2, X30/3, and X30/4. Terminal 29 functions as an output only in FC 302.

Functions dedicated to only 1 digital input are stated in the associated parameter.

All digital inputs can be programmed to these functions:

[0]	No operation	No reaction to signals transmitted to the terminal.
[1]	Reset	Resets frequency converter after a trip/alarm. Not all alarms can be reset.
[2]	Coast inverse	(Default digital input 27): Coast stop, inverted input (NC). The frequency converter leaves the motor in free mode. Logic 0⇒coast stop.
[3]	Coast and reset inverse	Reset and coast stop inverted input (NC). Leaves motor in free mode and resets frequency converter. Logic 0⇒coast stop and reset.
[4]	Quick stop inverse	Inverted input (NC). Generates a stop in accordance with quick stop ramp time set in *parameter 3-81 Quick Stop Ramp Time*. When the motor stops, the shaft is in free mode. Logic 0⇒quick stop.
[5]	DC brake inverse	Inverted input for DC brake (NC). Stops motor by energizing it with a DC current for a certain time period. See *parameter 2-01 DC Brake Current* to *parameter 2-03 DC Brake Cut In Speed [RPM]*. The function is only active when the value in *parameter 2-02 DC Braking Time* is different from 0. Logic 0⇒DC brake.
[6]	Stop inverse	Stop inverted function. Generates a stop function when the selected terminal goes from logical level 1 to logical level 0. The stop is performed according to the selected ramp time: • *Parameter 3-42 Ramp 1 Ramp Down Time*, • *Parameter 3-52 Ramp 2 Ramp Down Time*, • *Parameter 3-62 Ramp 3 Ramp down Time*, and • *Parameter 3-72 Ramp 4 Ramp Down Time*. ***NOTICE*** **When the frequency converter is at the torque limit and has received a stop command, it may not stop by itself. To ensure that the frequency converter stops, configure a digital output to *[27] Torque limit and stop*. Connect this digital output to a digital input that is configured as coast.**
[8]	Start	(Default digital input 18): Select start for a start/stop command. Logic 1 = start, logic 0 = stop.

[9]	Latched start	If a pulse is applied for minimum 2 ms, the motor starts. The motor stops when stop inverse is activated, or a reset command (via DI) is given.
[10]	Reversing	(Default digital input 19). Change the direction of motor shaft rotation. Select logic 1 to reverse. The reversing signal only changes the direction of rotation. It does not activate the start function. Select both directions in *parameter 4-10 Motor Speed Direction*. The function is not active in process closed loop.
[11]	Start reversing	Used for start/stop and for reversing on the same wire. Signals on start are not allowed at the same time.
[12]	Enable start forward	Disengages the counterclockwise movement and allows clockwise direction.
[13]	Enable start reverse	Disengages the clockwise movement and allows counterclockwise direction.
[14]	Jog	(Default digital input 29): Activate jog speed. See *parameter 3-11 Jog Speed [Hz]*.
[15]	Preset reference on	Shifts between external reference and preset reference. It is assumed that *[1] External/preset* has been selected in *parameter 3-04 Reference Function*. Logic 0 = external reference active; logic 1 = 1 of the 8 preset references is active.
[16]	Preset ref bit 0	Preset reference bit 0, 1, and 2 enable a choice between 1 of the 8 preset references according to *Table 6.3*.
[17]	Preset ref bit 1	Same as *[16] Preset ref bit 0*.
[18]	Preset ref bit 2	Same as *[16] Preset ref bit 0*.

Preset ref. bit	**2**	**1**	**0**
Preset ref. 0	0	0	0
Preset ref. 1	0	0	1
Preset ref. 2	0	1	0
Preset ref. 3	0	1	1
Preset ref. 4	1	0	0
Preset ref. 5	1	0	1
Preset ref. 6	1	1	0
Preset ref. 7	1	1	1

Table 6.3 Preset Reference Bit

[19]	Freeze ref	Freezes the actual reference, which is now the point of enable/condition to be used for *[21] Speed up* and *[22] Speed down*. If speed up/speed down is used, the speed change always follows ramp 2 (*parameter 3-51 Ramp 2 Ramp Up Time* and *parameter 3-52 Ramp 2 Ramp Down Time*) in the range 0–*parameter 3-03 Maximum Reference*.
[20]	Freeze output	Freezes the actual motor frequency (Hz), which is now the point of enable/condition to be used for *[21] Speed up* and *[22] Speed down*. If speed up/speed down is used, the speed change always follows ramp 2 (*parameter 3-51 Ramp 2 Ramp Up Time* and *parameter 3-52 Ramp 2 Ramp Down Time*) in the range 0–*parameter 1-23 Motor Frequency*. ***NOTICE*** **When freeze output is active, the frequency converter cannot be stopped via a low *[8] Start* signal. Stop the frequency converter via a terminal programmed for *[2] Coasting inverse* or *[3] Coast and reset inverse*.**
[21]	Speed up	Select *[21] Speed up* and *[22] Speed down* for digital control of the up/down speed (motor potentiometer). Activate this function by selecting either *[19] Freeze ref* or *[20] Freeze output*. When speed up/speed down is activated for less than 400 ms, the resulting reference is increased/decreased by 0.1%. If speed up/speed down is activated for more than 400 ms, the resulting reference follows the setting in ramping up/down parameters 3-x1/3-x2.

	Shut down	**Catch up**
Unchanged speed	0	0
Reduced by %-value	1	0
Increased by %-value	0	1
Reduced by %-value	1	1

Table 6.4 Shut Down/Catch Up

[22]	Speed down	Same as *[21] Speed up*.
[23]	Set-up select bit 0	Select *[23] Set-up select bit 0* or select *[24] Set-up select bit 1* to select 1 of the 4 set-ups. Set *parameter 0-10 Active Set-up* to Multi Set-up.
[24]	Set-up select bit 1	(Default digital input 32): Same as *[23] Set-up select bit 0*.
[26]	Precise stop inv.	Sends an inverted stop signal when the precise stop function is activated in *parameter 1-83 Precise Stop Function*. Precise stop inverse function is available for terminals 18 or 19.
[27]	Precise start, stop	Use when *[0] Precise ramp stop* is selected in *parameter 1-83 Precise Stop Function*. Precise start, stop is available for terminals 18 and 19. Precise start ensures that the rotor turning angle from standing still to reference is the same for each start (for same ramp time, same setpoint). This function is the equivalent to the precise stop where the rotor turning angle from reference to standing still is the same for each stop. When using *parameter 1-83 Precise Stop Function* option *[1] Cnt stop with reset* or *[2] Cnt stop w/o reset*:

		The frequency converter needs a precise stop-signal before reaching the value of *parameter 1-84 Precise Stop Counter Value*. If this signal is not supplied, the frequency converter does not stop when the value in *parameter 1-84 Precise Stop Counter Value* is reached. Trigger precise start, stop by a digital input. The function is available for terminals 18 and 19.
[28]	Catch up	Increases reference value by percentage (relative) set in *parameter 3-12 Catch up/slow Down Value*.
[29]	Slow down	Reduces reference value by percentage (relative) set in *parameter 3-12 Catch up/slow Down Value*.
[30]	Counter input	Precise stop function in *parameter 1-83 Precise Stop Function* acts as counter stop or speed compensated counter stop with or without reset. The counter value must be set in *parameter 1-84 Precise Stop Counter Value*.
[31]	Pulse edge triggered	Counts the number of pulse flanks per sample time. This gives a higher resolution at high frequencies, but is not as precise at lower frequencies. Use this pulse principle for encoders with low resolution (for example 30 PPR).  **Illustration 6.1 Pulse Flanks per Sample Time**
[32]	Pulse time-based	Measures the duration between pulse flanks. This gives a higher resolution at lower frequencies, but is not as precise at higher frequencies. This principle has a cutoff frequency, which makes it unsuited for encoders with low resolutions (for example 30 PPR) at low speeds.   **Illustration 6.2 Duration Between Pulse Flanks**
[34]	Ramp bit 0	Enables a selection between 1 of the 4 ramps available, according to *Table 6.5*.
[35]	Ramp bit 1	Same as *[34] Ramp bit 0*.

Preset ramp bit	**1**	**0**
Ramp 1	0	0
Ramp 2	0	1
Ramp 3	1	0
Ramp 4	1	1

Table 6.5 Preset Ramp Bit

[40]	Latched Precise Start	A latched precise start only requires a pulse of 3 ms on terminals 18 or 19. When using for *parameter 1-83 Precise Stop Function [1] Cnt stop with reset* or *[2] Cnt stop w/o reset*: When the reference is reached, the frequency converter internally enables the precise stop signal. This means that the frequency converter does the precise stop when the counter value of *parameter 1-84 Precise Stop Counter Value* is reached.
[41]	Latched Precise Stop inverse	Sends a latched stop signal when the precise stop function is activated in *parameter 1-83 Precise Stop Function*. The latched precise stop inverse function is available for terminals 18 or 19.
[51]	External interlock	This function makes it possible to give an external fault to the frequency converter. This fault is treated in the same way as an internally generated alarm.
[55]	DigiPot Increase	Increase signal to the digital potentiometer function described in *parameter group 3-9* Digital Pot. Meter*.
[56]	DigiPot Decrease	Decrease signal to the digital potentiometer function described in *parameter group 3-9* Digital Pot. Meter*.
[57]	DigiPot Clear	Clears the digital potentiometer reference described in *parameter group 3-9* Digital Pot. Meter*.
[60]	Counter A	(Terminal 29 or 33 only). Input for increment counting in the SLC counter.
[61]	Counter A	(Terminal 29 or 33 only). Input for decrement counting in the SLC counter.
[62]	Reset Counter A	Input for reset of counter A.
[63]	Counter B	(Terminal 29 or 33 only). Input for increment counting in the SLC counter.
[64]	Counter B	(Terminal 29 or 33 only). Input for decrement counting in the SLC counter.
[65]	Reset Counter B	Input for reset of counter B.
[70]	Mech. Brake Feedback	Brake feedback for hoisting applications: Set *parameter 1-01 Motor Control Principle* to *[3] Flux w/ motor feedback*; set *parameter 1-72 Start Function* to *[6] Hoist mech brake Ref.*

[71]	Mech. Brake Feedback inv.	Inverted brake feedback for hoisting applications.
[72]	PID error inverse	When enabled, this option inverts the resulting error from the process PID controller. Available only if *parameter 1-00 Configuration Mode* is set to *[6] Surface Winder*, *[7] Extended PID Speed OL*, or *[8] Extended PID Speed CL*.
[73]	PID reset I-part	When enabled, this option resets the I-part of the process PID controller. Equivalent to *parameter 7-40 Process PID I-part Reset*. Available only if *parameter 1-00 Configuration Mode* is set to *[6] Surface Winder*, *[7] Extended PID Speed OL*, or *[8] Extended PID Speed CL*.
[74]	PID enable	Enables the extended process PID controller. Equivalent to *parameter 7-50 Process PID Extended PID*. Available only if *parameter 1-00 Configuration Mode* is set to *[7] Extended PID Speed OL* or *[8] Extended PID Speed CL*.
[80]	PTC Card 1	All digital inputs can be set to *[80] PTC Card 1*. However, only 1 digital input must be set to this option.
[91]	PROFIdrive OFF2	The functionality is the same as the corresponding control word bit of the PROFIBUS/PROFINET option.
[92]	PROFIdrive OFF3	The functionality is the same as the corresponding control word bit of the PROFIBUS/PROFINET option.
[94]	Light Load Detection	Light load detection is a feature for lift application to ensure that the lift runs in the evacuation direction which requires the least energy (UPS capacity), during an emergency. See parameters *parameter 30-25 Light Load Delay [s]*, *parameter 30-26 Delay Before Measurements*, *parameter 30-27 Light Load Speed [%]*, *parameter 30-28 Evacuation Speed [%]*, and *parameter 30-29 Ramp Time* for light load detection configurations. ***NOTICE*** **Flying start overrules light load detection.**
[95]	Evacuation	Evacuation Mode is a feature for lift application to enable drives to operate at reduced DC-Voltage for evacuation of the people in case of power failure. When the feature is activated, under-voltage limits and enable voltage limits is reduced so that the drive can be operated with 230V single phase UPS-supply.
[96]	Mains Loss	Select to improve kinetic back-up. When the mains voltage goes back to a level that is close to (but still lower than) the detection level, the output speed increases and kinetic back-up remains active. To avoid this situation, send a status signal to the frequency converter. When the signal on the digital input is low (0), the frequency converter forcibly turns off the kinetic back-up. ***NOTICE*** **Only available for pulse inputs at terminals 32/33.**
[97]	Mains Loss Inverse	When the signal on the digital input is high (1), the frequency converter forcibly turns off the kinetic back-up. For more details, see the description of *[96] Mains loss*. ***NOTICE*** **Only available for pulse inputs at terminals 32/33.**
[98]	Start edge triggered	Edge-triggered start command. Keeps the start command alive. It can be used for a start push key.
[100]	Safe Option Reset	Resets the safety option. Available only when the safety option is mounted.
[106]	Set Master Home	***NOTICE*** **This option is available only with software version 48.XX.** Sets actual master position to the value of *parameter 17-88 Master Home Position*.
[107]	Target Inverse	***NOTICE*** **This option is available only with software version 48.XX.** Changes the sign of the set target position. For example, if the set target is 1000, the activation of this option changes the value to -1000.
[108]	Enable Master Offset	***NOTICE*** **This option is available only with software version 48.XX.** Activates the master offset selected in *parameter 3-26 Master Offset* when *parameter 17-93 Master Offset Selection* has a selection from *[1] Absolute* to *[5] Relative Touch Sensor*.
[109]	Enable Vir.Master	***NOTICE*** **This option is available only with software version 48.XX.** Enable signal for the virtual master function. Only applicable when *option [10] Synchronization* is selected in *parameter 1-00 Configuration Mode*.

6

[110]	Start Homing	***NOTICE*** **This option is available only with software version 48.XX.** Starts the homing function selected in *parameter 17-80 Homing Function*. Must remain high until homing is done, otherwise homing is aborted.
[111]	Activate Touch	***NOTICE*** **This option is available only with software version 48.XX.** Activates the monitoring of the touch sensor input.
[112]	Relative Position	***NOTICE*** **This option is available only with software version 48.XX.** This option selects between absolute and relative positioning. The option is valid for the next positioning command.
[113]	Enable Reference	***NOTICE*** **This option is available only with software version 48.XX.** Positioning mode: The frequency converter activates the selected positioning type and target and starts the motion towards the new target. The motion starts either immediately or when active positioning is completed, depending on settings of *parameter 17-90 Absolute Position Mode* and *parameter 17-91 Relative Position Mode*. Synchronization mode: High signal locks the actual follower position to the actual master position. The follower starts and catches up with the master. Low signal stops the synchronization and the follower makes a controlled stop.
[114]	Sync. to Pos. Mode	***NOTICE*** **This option is available only with software version 48.XX.** Select positioning in synchronization mode.
[115]	Home Sensor	***NOTICE*** **This option is available only with software version 48.XX.** Normally open contact for defining the home position. The function is defined in *parameter 17-80 Homing Function*.
[116]	Home Sensor Inv.	***NOTICE*** **This option is available only with software version 48.XX.** Normally closed contact for defining the home position. The function is defined in *parameter 17-80 Homing Function*.
[117]	Touch Sensor	***NOTICE*** **This option is available only with software version 48.XX.** Normally open contact. Serves as a reference for touch probe positioning.
[118]	Touch Sensor Inv	***NOTICE*** **This option is available only with software version 48.XX.** Normally closed contact. Serves as a reference for touch probe positioning.
[119]	Speed mode	***NOTICE*** **This option is available only with software version 48.XX.** Select the speed mode when *[9] Positioning* or *[10] Synchronization* is selected in *parameter 1-00 Configuration Mode*. Speed reference is set by reference resource 1 or fieldbus REF1 relative to *parameter 3-03 Maximum Reference*.
[122]	Position Vir. Master.	***NOTICE*** **This option is available only with software version 48.XX.** Activates position controlled virtual master when *[10] Synchronization* is selected in *parameter 1-00 Configuration Mode*. When the option is selected, the following occurs: • Target position is set by Fieldbus Pos Ref or preset target is as defined in *parameter 3-20 Preset Target*. • Speed is set relative to *parameter 3-27 Virtual Master Max Ref* by the source selected in *parameter 3-15 Reference Resource 1* or fieldbus REF1. • Acceleration and deceleration is set as defined in *parameter group 3-6* Ramp 3*.
[123]	Master Marker	***NOTICE*** **This option is available only with software version 48.XX.** Normally open contact. Serves as input for master marker signal during marker synchronization based on the option selected in *parameter 3-33 Sync. Mode & Start Behavior*.
[124]	Master Marker Inv.	***NOTICE*** **This option is available only with software version 48.XX.** Normally closed contact. Activates master marker signal for marker synchronization based on the option selected in *parameter 3-33 Sync. Mode & Start Behavior*.

[125]	Follower Marker	***NOTICE*** **This option is available only with software version 48.XX.** Normally open contact. Serves as input for follower marker signal during marker synchronization based on the option selected in *parameter 3-33 Sync. Mode & Start Behavior*.
[126]	Follow Marker Inv	***NOTICE*** **This option is available only with software version 48.XX.** Normally closed contact. Serves as input for follower marker signal during marker synchronization based on the option selected in *parameter 3-33 Sync. Mode & Start Behavior*.
[231]	Power Limit Mot.	Serves as input to activate the power limit function in the motor mode. See *parameter group 4-8* Power Limit*.
[232]	Power Limit Gen.	Serves as input to activate the power limit function in the generating mode. See *parameter group 4-8* Power Limit*.
[233]	Power Limit Both	Serves as input to activate the power limit function in both the motor and the generating mode. See *parameter group 4-8* Power Limit*.
[234]	Light Load + Evacuation	Use this option to activate both light load detection and evacuation.

5-12 Terminal 27 Digital Input

Functions are described in *parameter group 5-1* Digital Inputs*.

Option:		Function:
[0]	No operation	
[1]	Reset	
[2]	Coast inverse	
[3]	Coast and reset inv	
[4]	Quick stop inverse	
[5]	DC-brake inverse	
[6]	Stop inverse	
[8]	Start	
[9]	Latched start	
[10]	Reversing	
[11]	Start reversing	
[12]	Enable start forward	
[13]	Enable start reverse	
[14]	Jog	
[15]	Preset reference on	
[16]	Preset ref bit 0	
[17]	Preset ref bit 1	
[18]	Preset ref bit 2	

5-12 Terminal 27 Digital Input

Functions are described in *parameter group 5-1* Digital Inputs*.

Option:		Function:
[19]	Freeze reference	
[20]	Freeze output	
[21]	Speed up	
[22]	Speed down	
[23]	Set-up select bit 0	
[24]	Set-up select bit 1	
[28]	Catch up	
[29]	Slow down	
[34]	Ramp bit 0	
[35]	Ramp bit 1

5-13 Terminal 29 Digital Input

Select the function from the available digital input range and the additional options *[60] Counter A*, *[61] Counter A*, *[63] Counter B*, and *[64] Counter B*. Counters are used in smart logic control functions.

Option:		Function:
[233]	Power Limit Both	

6.1.2 5-3* Digital Outputs

5-30 Terminal 27 Digital Output

This manual only shows the option relevant for the VLT® Advanced Harmonic Filter AHF 005/AHF 010. Refer to the frequency converter programming guide for the complete list of options in this parameter.

Option:		Function:
[188]	AHF Capacitor Connect	***NOTICE*** **This function is not suitable when multiple frequency converters are connected to a single filter.** The capacitors are turned on at 20% (hysteresis of 50% gives an interval of 10–30%). The capacitors are disconnected below 10%. The off delay is 10 s and restarts if the nominal power goes above 10% during the delay. *Parameter 5-80 AHF Cap Reconnect Delay* is used to guarantee a minimum off-time for the capacitors.

5-40 Function Relay

This manual only shows the option relevant for the VLT® Advanced Harmonic Filter AHF 005/AHF 010. Refer to the frequency converter programming guide for the complete list of options in this parameter.

Option:		Function:
[188]	AHF Capacitor Connect	***NOTICE*** **This function is not suitable when multiple frequency converters are connected to a single filter.** The capacitors are turned on at 20% (hysteresis of 50% gives an interval of 10–30%). The capacitors are disconnected below 10%. The off delay is 10 s and restarts if the nominal power goes above 10% during the delay. *Parameter 5-80 AHF Cap Reconnect Delay* is used to guarantee a minimum off-time for the capacitors.

6

5-80 AHF Cap Reconnect Delay		
Range:		**Function:**
25 s*	[1 - 120 s]	Guarantees a minimum off-time for the capacitors. The timer starts once the AHF capacitor disconnects and has to expire before the output is allowed to be on again. It only turns on again if the frequency converter power is 20–30%.

6.1.3 DC-link Compensation Disabling

NOTICE

To prevent resonances in the DC link, disable the dynamic DC-link compensation by setting *parameter 14-51 DC-Link Compensation* to *[0] Off*.

The FC series includes a feature which ensures that the output voltage is independent of any voltage fluctuation in the DC link, for example, caused by fast fluctuation in the mains supply voltage. Sometimes, this dynamic compensation can produce resonances in the DC link and should then be disabled. Typical cases are where VLT® Advanced Harmonic Filter AHF 005/AHF 010 is used on supply grids with high short circuit ratio. Fluctuations can often be recognized by increased acoustic noise and, in extreme cases, by unintended tripping.

14-51 DC-Link Compensation		
Option:		**Function:**
		The rectified AC-DC voltage in the frequency converter's DC link is associated with voltage ripples. These ripples can increase in magnitude with increased load. These ripples are undesirable because they can generate current and torque ripples. A compensation method is used to reduce these voltage ripples in the DC link. In general, DC-link compensation is recommended for most applications, but pay attention when operating in field weakening as it can generate speed oscillations at the motor shaft. In field weakening, turn off DC-link compensation.
[0]	Off	Disables DC-link compensation.
[1]	On	Enables DC-link compensation.

7 Specifications

7.1 General Specifications

Mains supply types[1)]	380 V/60 Hz
	400 V/50 Hz
	460 V/60 Hz
	600 V/60 Hz
	690 V/50 Hz
Nominal supply voltages[1)]	380–415 V/60 Hz
	380–415 V/50 Hz
	440–480 V/60 Hz
	600 V/60 Hz
	500–690 V/50 Hz
Supply voltage tolerance	+/- 10%
Tolerances of the actual supply voltage	342–456 V/60 Hz
	342–456 V/50 Hz
	396–528 V/60 Hz
	540–660 V/60 Hz
	450–759 V/50 Hz
Supply frequency tolerance	+/- 2%
Power loss	See *chapter 7.3 Power Loss and Acoustic Noise Level*
Acoustic noise level	See *chapter 7.3 Power Loss and Acoustic Noise Level*
Overload capacity	160% for 60 s every 10 minutes
Efficiency	> 0.98
THDi[2)]	AHF 005 < 5%
	AHF 010 < 10%
Cos φ of IL	0.5 cap at 25% $I_{AHF,N}$
	0.8 cap at 50% $I_{AHF,N}$
	0.85 cap at 75% $I_{AHF,N}$
	0.99 cap at 100% $I_{AHF,N}$
	1.0 at 160% $I_{AHF,N}$
Power derating - temperature	Without derating: 5–45 °C (41–113 °F) With derating: 45–60 °C (113–140 °F) 1.5% per degree. See derating curve in *Illustration 7.1*.
Power derating - altitude above sea level	1000 m (3280 ft) without derating
	1000–4000 m (3280–13123 ft) 5% per 1000 m (3280 ft)

Table 7.1 General Technical Data

1) The fan control system supports extended input voltage range as 200–415 V for the 380 V/60 Hz and 400 V/50 Hz programs. The 380 V/60 Hz and the 400 V/50 Hz programs can be operated with 200–240 V mains supply.

2) THDi level is system level performance from the filter combined with the actual frequency converter.

NOTICE

The reduction of the low harmonic current emission to the rated THDi implies that the THDv of the non-influenced mains voltage is lower than 2%, and the ratio of short circuit power to installed load (R_{SCE}) is above 66. Under these conditions, the THDi of the mains current of the frequency converter is reduced to 10% or 5% (typical values at nominal load). If these conditions are not or only partially fulfilled, a significant reduction of the harmonic components can still be achieved, but the rated THDi values may not be observed.

7.2 Environmental Data

Ambient temperature during operation	5–45 °C (41–113 °F) without derating 45–60 °C (113–140 °F) with derating 1.5% per °C. See derating curve in *Illustration 7.1*
Temperature during storage and transportation	Transport: -25 °C to +65 °C (-13 °F to +149 °F)
	Storage: -25 °C to +55 °C (-13 °F to 131 °F)
Maximum altitude above sea level	1000 m (3280 ft) without derating
	1000–4000 m (3280–13123 ft) with derating 5% per 1000 m (3280 ft)
Relative humidity	Humidity class F without condensation 5–85% - Class 3K3 (non-condensing) during operation
Resonance search	Base standard: DIN EN 600068-2-6 Test specification: 5 Hz, 150 Hz, 3 directions (0.5 g, 0.1 g, 0.5 g)
Sine vibration test	Base standard: DIN EN 600068-2-6 Test specification: 5–13.2 Hz, 150 Hz (2 mm (0.08 in) peak to peak 0.7 g)
Packaging	ISPM 15
Enclosure protection rating	IP20 Optional IP21/NEMA1 upgrade kits
Approvals	CE
	The Low Voltage Directive
	UL[1)]
	UL SCCR 100 kA
Standards	Radiated Immunity, IEC 61800-3, 2012 edition 2.1
	Burst, EN 61000-4-4
	Surge, EN 61000-4-5
	ESD, EN 61000-4-2
	Radiated Field-CM, IEC 61800-3, 2012 edition 2.1
	PELV in accordance to EN 61800-5-1 for the temperature switches

Table 7.2 Environmental Data

1) UL only for 460 V/60 Hz and 600 V/60 Hz versions. UL listing card reference ID number: E134261

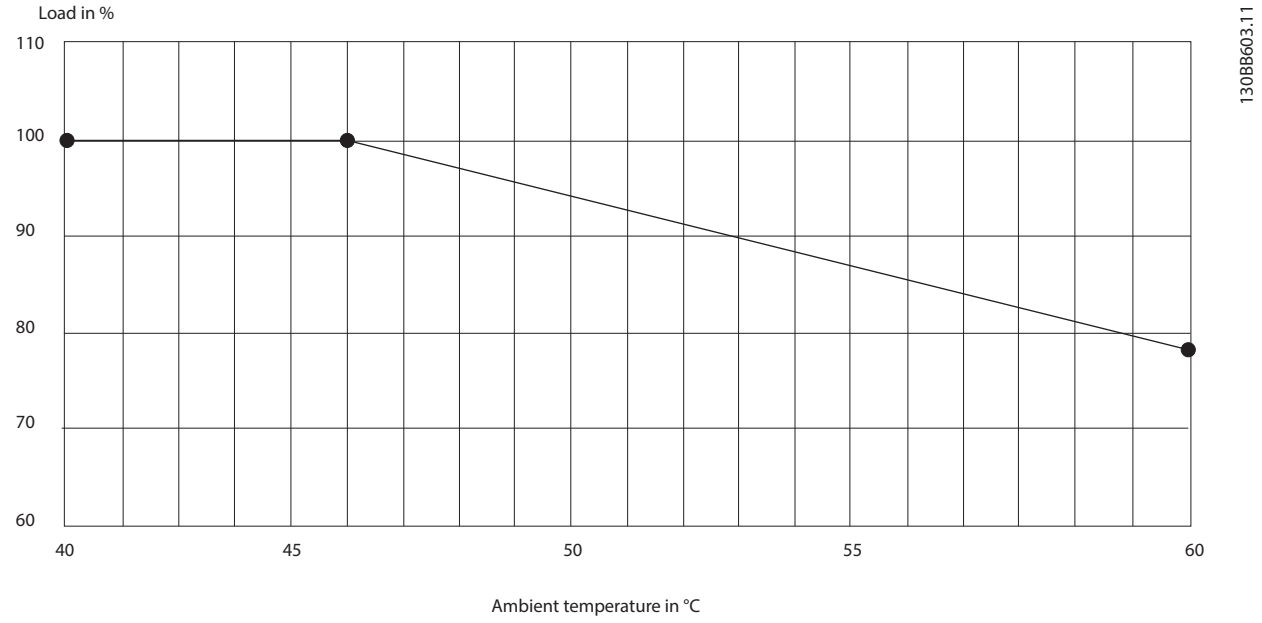

Illustration 7.1 Temperature Derating Curve

7.3 Power Loss and Acoustic Noise Level

Table 7.3 explains in detail the terminology used in the power loss and acoustic noise level tables. See *Table 7.4* to *Table 7.8*.

Value	Description
Current rating	Filter nominal current rating
Order numbers	AHF part number for ordering.
AHF 005	AHF version with performance level of 5% THDi or better at system level with nominal load
AHF 010	AHF version with performance level of 10% THDi or better at system level with nominal load
Power loss	Power loss according to EN50598 Ecodesign for PDS at percentage load (0, 25, 50, 75, 100) of nominal current. The power loss references are with 25 °C (77 °F) ambient temperatue
Acoustic noise level	Maximum acoustical noise level from filter at 1 m (3.28 ft)distance with nominal loading at 25°C (77°F) ambient temperature. Maximum level typical at nominal loading.

Table 7.3 Terminology in Power Loss and Acoustic Noise Level Tables

NOTICE

The tables in *chapter 7.3 Power Loss and Acoustic Noise Level* are only valid for VLT® Advanced Harmonic Filter AHF 005/AHF 010 revision 03.

Table 7.18 AHF 010: 500–690 V, 50 Hz

7.4.1 Terminal Specifications

Table 7.19 to *Table 7.23* show the terminal types, cable cross-section, tightening torque, and more.

NOTICE

The maximum cable cross-sections in tables *Table 7.19* to *Table 7.23* are for solid cables. The maximum cross-sections for multi-core cables can be seen in the terminal specifications on the illustrations in *chapter 7.4.2 IP20 Enclosures*.

NOTICE

The illustrations in *chapter 7.4.3 IP21 Enclosures* are displaying the complete unit: The AHF IP20 filter with the matching optional IP21/NEMA 1 upgrade kit mounted. The illustrations all show filters with external fan, but the dimensions are valid for filters with both internal and external fan. Always mount the AHF according to the definitions valid for the basic AHF IP20 unit.

7.5 Fuses

To protect the installation against electrical and fire hazards, all filters in an installation must be protected against short-circuiting and overcurrent according to national and international regulations.

To protect both frequency converter and filter, select the type of fuses recommended in the frequency converter *design guide*. The maximum fuse rating per filter size is listed in *Table 7.24* to *Table 7.27*.

Filter current rating	Maximum fuse size	Fuses
[A]	[A]	(type)
10	16	gRL 690 V AC
14	35	gRL 690 V AC
22	35	gRL 690 V AC
29	50	gRL 690 V AC
34	50	gRL 690 V AC
40	63	gRL 690 V AC
55	80	gRL 690 V AC
66	125	gRL 690 V AC
82	160	gRL 690 V AC

Table 7.26 600 V, 60 Hz

1) Specified type is a UL requirement.

Filter current rating	Maximum fuse size	Fuses
[A]	[A]	(type)
15	35	gRL 690 V AC
20	35	gRL 690 V AC
24	50	gRL 690 V AC
29	50	gRL 690 V AC
36	63	gRL 690 V AC
50	80	gRL 690 V AC
58	125	gRL 690 V AC
77	160	gRL 690 V AC
87	250	gRL 690 V AC
109	250	gRL 690 V AC
128	250	gRL 690 V AC
155	315	gRL 690 V AC
197	350	gRL 690 V AC
240	400	gRL 690 V AC
296	500	gRL 690 V AC
366	630	gRL 690 V AC
395	630	gRL 690 V AC

Table 7.27 500–690 V, 50 Hz

In applications where filters are paralleled, it might be necessary to install fuses in front of each filter and in front of the frequency converter.

8 Spare Parts

NOTICE

ATTENTION TO REVISION NUMBER DURING SERVICING

The VLT® Advanced Harmonic Filter AHF 005/AHF 010 program is constantly optimized, introducing differences between the individual designs. Vital differences are managed through revision control of the individual designs.

Differences between the individual revisions can lead to different spare parts. It is important to select matching spare parts according to the revision number of the actual filter.

The spare part selection tables include a reference to the matching revision number in the AHF serial number string.

The specific revision number is identified in the serial number string of the AHF listed on the nameplate of the actual filter. Characters 5 and 6 in the serial number string are the identifiers of the revision number.

Since the introduction of the AHF program, the following revisions have been introduced:

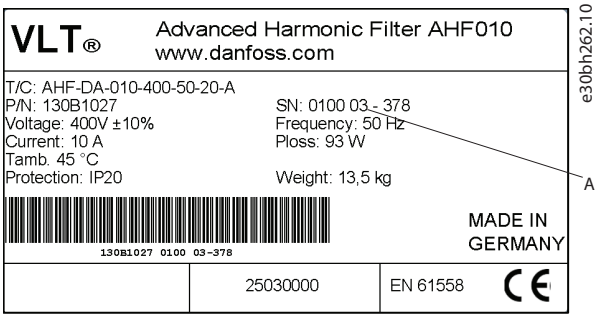
- **01**
- **02**
- **03**

The current version, featuring variable speed fan, is identified by revision number 03.

Example:

SN: 0100 03 - 378

Characters 5 and 6 are 03, confirming that this is revision number 03.



A	Identification of revision number

Illustration 8.1 Product Label

⚠WARNING

DISCHARGE TIME

The VLT® Advanced Harmonic Filters AHF 005/AHF 010 contain capacitors. The capacitors can remain charged even when the filter is not powered. Failure to wait the specified time after power has been removed before performing service or repair work can result in death or serious injury.

1. **Stop the frequency converter and the motor.**
2. **Disconnect AC mains, permanent magnet type motors, remote DC-link supplies including battery back-ups, UPS, and DC-link connections to other frequency converters.**
3. **Wait the required time specified on the nameplate, ensuring that the capacitors are discharged fully, before performing any service or repair work on the filter.**
4. **Before performing any service or repair work on the filter, ensure that the voltage is 0 between the filter terminals X3.1, X3.2, and X3.3, and between the filter terminals X4.1, X4.2, and X4.3.**

8

8.1 Selection Tables

8.1.1 Capacitor Kits for Revisions 01 and 02

The spare part capacitor kits are complete kits including cabling and accessories for replacement.

The spare part capacitor kits are supporting the following filter programs:

- VLT® Advanced Harmonic Filter AHF 005, revisions 01 and 02.
- VLT® Advanced Harmonic Filter AHF 010, revisions 01 and 02.

See *chapter 8.1.2 Capacitor Kits for Revision 03* for spare part capacitor kits supporting revision 03.

NOTICE

The spare part kits are designed individually for the revision numbers 01, 02, and 03.
For spare parts for revision 01 and 02, see *Table 8.1* to *Table 8.5*.
For spare parts for revision 03, see *Table 8.6* to *Table 8.10*.

Table 8.5 Capacitor Kits, 500–690 V, 50 Hz

8.1.2 Capacitor Kits for Revision 03

The spare part capacitor kits are complete kits including cabling and accessories for replacement.

The spare parts for fans are supporting the following filter programs:

- VLT® Advanced Harmonic Filter AHF 005, revision 03.
- VLT® Advanced Harmonic Filter AHF 010, revision 03.

NOTICE

The spare part kits are designed individually for the revision numbers 01, 02, and 03.
For spare parts for revision 01 and 02, see *Table 8.1* to *Table 8.5*.
For spare parts for revision 03, see *Table 8.6* to *Table 8.10*.

Table 8.10 Capacitor Kits, 500–690 V, 50 Hz

8.1.3 Terminals

Items supplied, terminal kits

- Terminal X1–X2: Each kit contains 3 terminal blocks, including labels for matching designations.
- Terminal X3–X4: Each kit contains 3 terminal blocks, including labels for matching designations.
- Terminal A+B: Each kit contains 3 terminal blocks, including labels for matching designations.

The spare part terminal kits are valid for revisions 01, 02, and 03, and support the following filter programs:

- VLT® Advanced Harmonic Filter AHF 005
- VLT® Advanced Harmonic Filter AHF 010

Table 8.14 Terminal Kits, 500–690 V 50 Hz

8.1.4 Fan and Fan Accessories for Revisions 01 and 02

Items supplied, fan kits and accessories

- Fan: The spare part fan kit contains 1 fan.
- Fan fence: The spare part fan fence kit contains 1 fence.
- Transformer: The spare part transformer kit contains 1 transformer.

The spare part fan kits support:

- VLT® Advanced Harmonic Filter AHF 005, revision 01 and 02.
- VLT® Advanced Harmonic Filter AHF 010, revision 01 and 02.

See *chapter 8.1.5 Fan and Fan Accessories for Revision 03* for fan and fan accessories supporting revision 03.

NOTICE

The spare part kits are designed individually for the revision numbers 01, 02, and 03
For spare parts for revision 01 and 02, see *Table 8.15* to *Table 8.18*.
For spare parts for revision 03, see *Table 8.19* to *Table 8.28*.

Table 8.18 Fan Kits and Accessories, 500–690 V, 50 Hz

8.1.5 Fan and Fan Accessories for Revision 03

Items supplied, fan kits and accessories

- Fan: The spare part fan kit contains 1 fan.
- Fan fence: The spare part fan fence kit contains 1 fence. Note that enclosures with integrated fan (internal fan) have no separate fan fence.
- Transformer: The spare part transformer kit contains 1 transformer.

The spare part fan kits support:

- VLT® Advanced Harmonic Filter AHF 005, revision 03.
- VLT® Advanced Harmonic Filter AHF 010, revision 03.

NOTICE

The spare part kits are designed individually for the revision numbers 01, 02, and 03.
For spare parts for revision 01 and 02, see *Table 8.15* to *Table 8.18*.
For spare parts for revision 03, see *Table 8.19* to *Table 8.28*.

8.1.6 Fuses and Fuse Accessories

Fan fuses: The spare fuse kits contain 10 fuses.

The spare part fuse kits support the following filter programs:

- VLT® Advanced Harmonic Filter AHF 005
- VLT® Advanced Harmonic Filter AHF 010

NOTICE

The spare part kits are designed individually for the revision numbers 01, 02, and 03.
For spare parts for revision 01 and 02, see *Table 8.29*.
For spare parts for revision 03, see *Table 8.30*.

Table 8.30 Fuse Kits and Accessories, Valid for Revision 03

1) No fuses - Fuses are only for 600 V and 690 V types utilizing an additional transformer in front of the fan control.

9 Appendix

9.1 Energy Efficiency

9.1.1 Introduction to Energy Efficiency

The standard *IEC 61800-9-2 Ecodesign for power drive systems* provides guidelines for assessing the energy efficiency of drives.

The standard provides a neutral method for determining efficiency classes and power losses at full load and at part load. The standard allows combination of any motor with any drive.

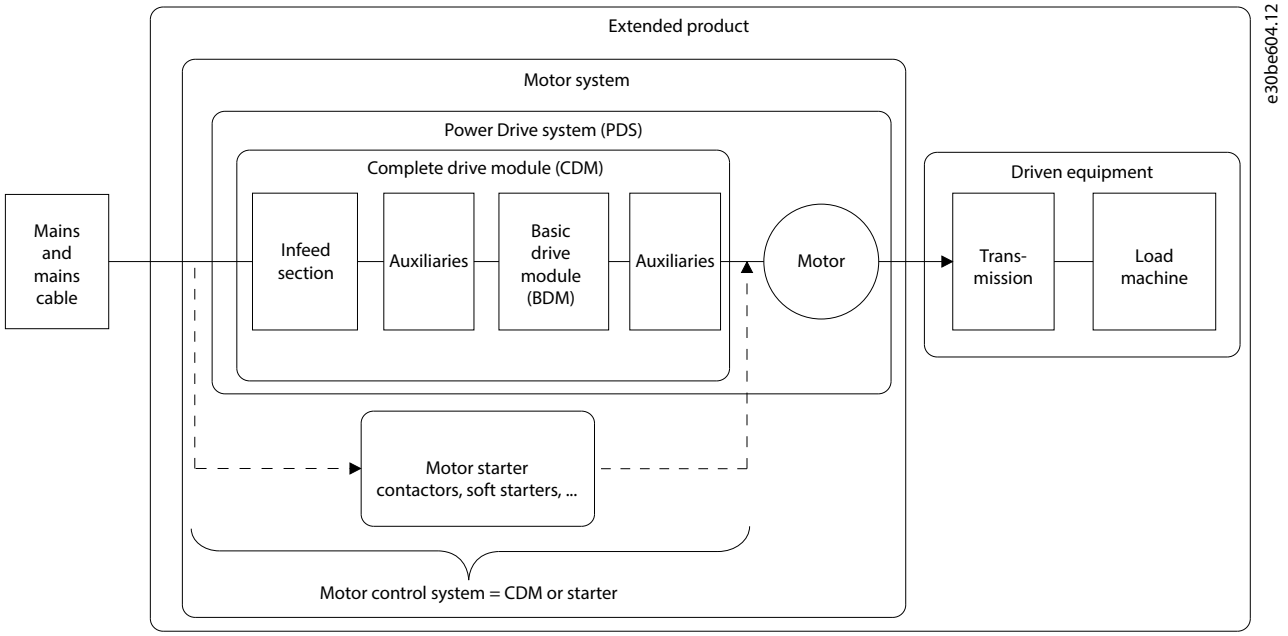

Illustration 9.1 Power Drive System (PDS) and Complete Drive Module (CDM)

Auxiliaries:

- VLT® Advanced Harmonic Filter AHF 005
- VLT® Advanced Harmonic Filter AHF 010
- VLT® Line Reactor MCC 103
- VLT® Sine-wave Filter MCC 101
- VLT® dU/dt Filter MCC 102

9.1.2 IE and IES Classes

Complete drive modules (CDM)
According to the standard IEC 61800-9-2, the complete drive module comprises the frequency converter, its feeding section, and its auxiliaries.

Energy efficiency classes for the CDM:

- IE0 = below state of the art.
- IE1 = state of the art.
- IE2 = above state of the art.

Danfoss frequency converters fulfill energy efficiency class IE2. The energy efficiency class is defined at the nominal point of the CDM.

Power drive systems (PDS)
A power drive system consists of a complete drive module and a motor.

Energy efficiency classes for the PDS:

- IES0 = Below state of the art.
- IES1 = State of the art.
- IES2 = Above state of the art.

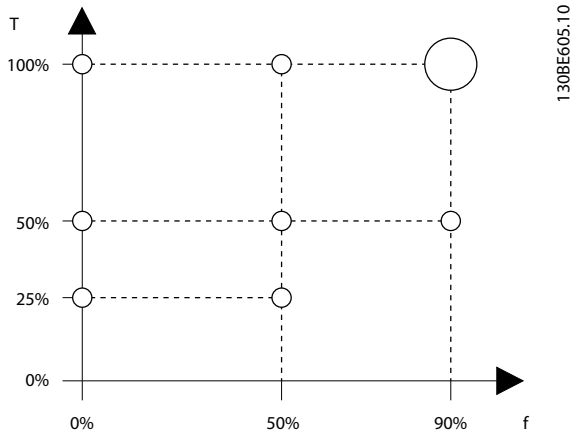
Depending on the motor efficiency, motors driven by a Danfoss VLT® frequency converter typically fulfill energy efficiency class IES2.

The energy efficiency class is defined at the nominal point of the PDS and can be calculated based on the CDM and the motor losses.

9.1.3 Power Loss Data and Efficiency Data

The power loss and the efficiency of a drive depend on configuration and auxiliary equipment. To get a configuration-specific power loss and efficiency data, use the Danfoss MyDrive ecoSmart tool.

The power loss data is provided in % of rated apparent output power and are determined according to IEC 61800-9-2. When the power loss data are determined, the drive uses the factory settings except for the motor data which is required to run the motor.



T	Torque-producing current [%]
f	Frequency [%]

Illustration 9.2 Drive Operating Points According to IEC 61800-9-2

Use the Danfoss MyDrive ecoSmart application to calculate the power loss data and efficiency data of the drive at the operating points, and at the IE and IES efficiency classes. The application is available at *www.ecosmart.danfoss.com*.

Example of available data

The following example shows power loss and efficiency data for a drive with the following characteristics:

- Power rating 55 kW (75 hp), rated voltage at 400 V.
- Rated apparent power, S_r, 67.8 kVA.
- Rated output power, P_{CDM}, 59.2 kW (79.4 hp).
- Rated efficiency, η_r, 98.3%.

Illustration 9.3 and *Illustration 9.4* show the power loss and efficiency curves. The speed is proportional to the frequency.

Illustration 9.4 Drive Efficiency Data.
CDM Efficiency ($\eta_{CDM(freq,\ load)}$) [%] versus Speed (n) [% of Nominal Speed].

Interpolation of power loss
Determine the power loss at an arbitrary operating point using 2-dimensional interpolation.

9.1.4 Losses and Efficiency of a Motor

The efficiency of a motor running at 50–100% of the nominal motor speed and at 75–100% of the nominal torque is practically constant. This is valid both when the frequency converter controls the motor, or when the motor runs directly on mains.

The efficiency depends on the type of motor and the level of magnetization.

For more information about motor types, refer to the motor technology brochure at *www.danfoss.com*.

9.1.5 Losses and Efficiency of a Power Drive System

To estimate the power losses at different operating points for a power drive system, sum the power losses at the operating point for each system component:

- Drive
- Motor
- Auxiliary equipment

9.1.6 Losses and Efficiency of a Power Drive System with Installed Filter

The MyDrive ecoSmart calculation tool can be used for system calculations and creating an energy efficiency report. The tool can be found via *www.ecosmart.danfoss.com*.

The power loss of the VLT® Advanced Harmonic Filter AHF005/AHF010 is specified in 5 different operating points as 0–100% load. The current load and power loss are specified in each operating point. See *Table 7.4* for power losses.

The power loss in the AHF depends on the operating point and is a function of the input current in the AHF. The identification point of operation of the AHF is based on the input current to the frequency converter. The input current of the frequency converter equals the input current to the AHF.
$I_{In,AHF}=I_{In,VLT}$

The output current of the frequency converter consists of the torque-producing component and the motor magnetization component. Different factors affect the relationship between the input current and output current of a frequency converter. For example, part load causes a significant difference between the 2 currents.
$I_{In,VLT} \neq I_{out,VLT}$

Calculate the input current of the frequency converter with this formula:
$I_{In,VLT}=I_{out,VLT}$ x cos(phi) x f_{motor} [%] x $load_{motor}$ [%] x 1.02

- $I_{out,VLT}$: Nominal output current from the frequency converter. Find the data in the frequency converter *design guide* or MyDrive ecoSmart.
- Cos (phi): Motor power factor. Find the data on the motor nameplate. Alternatively, use a reference value from IEC 61800-9-2, see *Table 9.1*.
- f_{motor} [%]: Percentage value of the nominal operating frequency in the motor in the range 0–1.

- $load_{motor}$ [%]: Percentage value of the torque-producing component or torque-producing current in the motor in the range 0–1. The value is typically from the design of the application.

The IEC 61800-9-2 standard for *Ecodesign of Power Drive Systems* allows the use of reference values. Determine the motor cosine phi value by the motor nominal power rating as kVA and with linear interpolation from the reference values in *Table 9.1*.

Nominal power [kVA]	Current [%]	Cosine phi
0.278	100	0.73
1.29	100	0.79
7.94	100	0.85
56.9	100	0.86
245	100	0.87

Table 9.1 Motor Reference Values from IEC 61800-9-2

9.1.6.1 Calculation Example

The frequency converter used in the example is a VLT® AutomationDrive FC 302, T5, 22 kW with Class A1/B RFI filter and enclosure protection rating IP20.

Frequency converter values

- $I_{out,VLT}$=44 A.
- Cos phi=0.85.
- f_{motor} [%]=25 Hz, resulting in 50%.
- $load_{motor}$ [%]=33 A, resulting in 75% (33 A/44 A x 100).

In the example, VLT® Advanced Harmonic Filter AHF 010 with order number 130B1111 is selected as filter. See *Table 5.3* for further specifications of the filter.

AHF values

- 40 A nominal current.
- AHF 010, THDi = 10%.
- IP20.

Calculating the frequency converter input current

$I_{In,VLT}=I_{out,VLT}$ x cos(phi) x f_{motor} [%] x $load_{motor}$ [%] x 1.02
$I_{In,VLT}$=44 x 0.85 x 0.50 x 0.75 x 1.02=14.3 A

Calculating the AHF input current

$I_{In,AHF}=I_{In,VLT}$=14.3 A

Calculating the power loss

Matching values from the tables in *chapter 7.3 Power Loss and Acoustic Noise Level*

- 86 W power loss at 10 A current loading.
- 142 W power loss at 20 A current loading.

Determining the power loss, $Loss_{OPT}$, in AHF point of operation $load_{OPT}$ using 2-dimensional interpolation

- $Loss_2$=142 W.
- $Loss_1$=86 W.
- $Load_2$=20 A.
- $Load_1$=10 A.
- $Load_{OPT}$ = $Load_{AHF}$ = Load of AHF in point of operation = 14.3 A.
- $Loss_{OPT}$ = $Loss_{AHF}$ = Loss in AHF in point of operation.

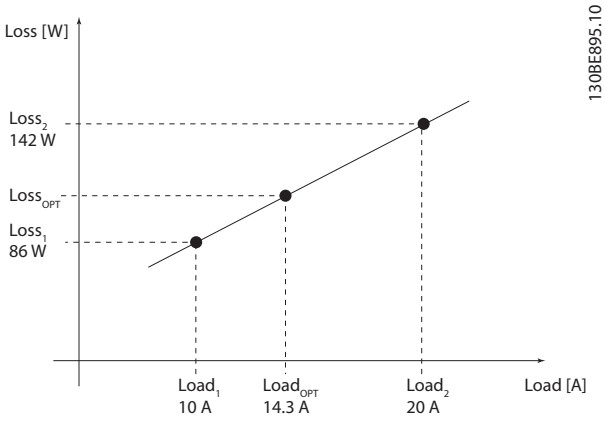

Illustration 9.5 Determining Power Loss with 2-dimensional Interpolation

$Loss_{OPT}$ = $Loss_1$ + ($Loss_2$ - $Loss_1$) x (($Load_{OPT}$ – $Load_1$) / ($Load_2$ – $Load_1$))
$Loss_{OPT}$ = $Loss_{AHF}$ = 86 + (142 - 86) x ((14.3 - 10) / (20 - 10)) = 110 W

For system calculations and energy efficiency report, use the MyDrive ecoSmart tool.

The power loss of the frequency converter provided by MyDrive ecoSmart:

- Power loss @ 50% motor frequency and 50% motor current = 249 W.
- Power loss @ 50% motor frequency and 100% motor current = 490 W.

The power loss of the frequency converter at 50% motor frequency and 75% torque-producing current are found by 2-dimensional interpolation as 370 W.
$Loss_{VLT}$ = 370 W.

Alternatively, identify the power loss of the frequency converter by entering the point of operation in MyDrive ecoSmart as a user-defined operating point.

To determine the power loss of the CDM, sum up the power losses in the operating point of the AHF and the frequency converter:
$Loss_{CDM}$ = $Loss_{AHF}$ + $Loss_{VLT}$ = 110 W + 370 W = 480 W
